CALIFORNIA TABLE OLIVE FORECAST FOR 2023

RESULTS

The 2023 California table olive forecast is 41,000 tons, up considerably from last year's crop of 19,912 tons, according to a survey conducted by the USDA, National Agricultural Statistics Service, Pacific Regional Office. Bearing acreage is estimated at 12,400, which results in a yield of 3.31 tons per acre.

The Manzanillo production forecast is 39,000 tons, Sevillano production forecast is 1,900 tons, and other varieties are expected to total 100 tons.

Record snowfall and a series of atmospheric rivers brought relief to the state's drought. Availability of water was not an issue and many growers reported a heavy bloom on drought stressed trees that had not produced fruit in years. However, unprecedented stormy conditions and flooding hindered bee pollination activity and damaged blooms, causing low fruit sets in some areas. Growers reported variable crop yields by both variety and area. Manzanillo yields were considerably higher than Sevillano yields. Marketing issues continued to be the biggest challenge for California olives growers, with many uncertain how much of their crop will be economical to harvest.

SURVEY SAMPLE

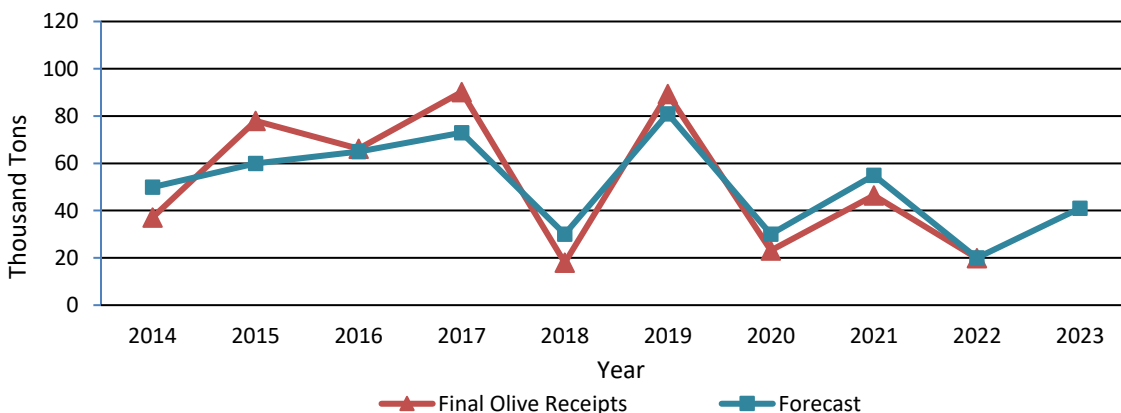

There were 301 growers sampled for the survey. Reports from 199 were used to establish this forecast. The sample is designed to provide a State estimate of all varieties; estimates by variety are less precise.

ACKNOWLEDGMENTS

A special thanks goes to the many olive growers who participated in the survey. Time spent completing the survey is appreciated, and helpful in estimating current condition of the olive industry in California.

The California Table Olive Forecast is funded by the California Olive Committee.

California Table Olive Production
Forecast vs. Final Production
2014-2023

Final olive receipts are published in the Weekly Olive Receipts Report.
