

# 1992 CALIFORNIA WALNUT OBJECTIVE MEASUREMENT SURVEY RESULTS

RELEASED: September 2, 1992  
12:00 Noon PDT

CALIFORNIA AGRICULTURAL  
STATISTICS SERVICE

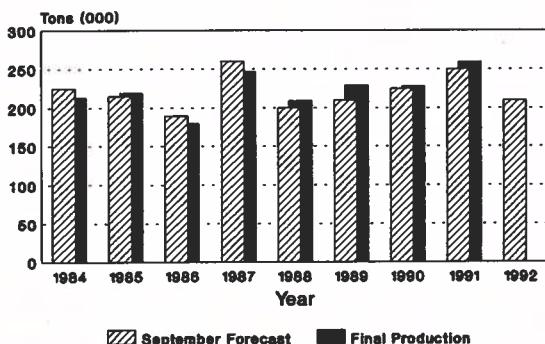

## WALNUT PRODUCTION FORECAST

The 1992 California walnut production forecast is 210,000 tons, down 19 percent from 1991's record high production of 259,000 tons. This is down 5 percent from the July forecast. The July forecast was based on subjective information provided by growers, while the September forecast is based on the Walnut Objective Measurement Survey along with subjective grower information. The Objective Measurement Survey was conducted July 27 through August 14, 1992.

The 1992 Objective Measurement Survey utilized a total of 598 blocks with two sample trees per block. The survey data indicated an average number of nuts per tree of 1,604, down 31 percent from 1991's average of 2,340. The Hartley nut set was down 26 percent; the Chandler, down 47 percent; and the Eureka down more than 50 percent. The percent of sound kernels in-shell was 96.9 percent Statewide. The in-shell weight per nut was rather high at 22.7 grams, while the average in-shell suture measurement was 32.6 millimeters. The average length in-shell was 39.5 millimeters.

Estimated nut sets, sizing measurements, average number of trees per acre, and estimated bearing acreage were used in the regression formulas utilizing the years 1980-1991.

## CALIFORNIA WALNUTS September Forecast vs. Final Production

California Ag. Statistics Service

## SURVEY HISTORY

The Walnut Objective Measurement Survey began in 1958 to fulfill industry needs for an accurate walnut production forecast prior to harvest. The original sample was chosen proportionally to county and variety of bearing acreage. With each succeeding year, additions and deletions have been made in the sample to adjust for acreage removed, new bearing acreage and refusals.

## SAMPLING PROCEDURES

Once a block is randomly selected and permission is granted, two trees are randomly selected. An accessible branch is chosen which is five to fifteen percent of the total cross-sectional area of the primary limbs and reachable with a twelve foot ladder. Measurements are made on the trunk, each primary, and each split leading to and including the accessible branch. The sample tree and accessible branch are marked by a single tag.

On the accessible branch, every first of five nuts is picked for use in size and grade determinations. If available, at least ten nuts are harvested from the accessible branch for this purpose.

The following measurements are made on nuts selected for sizing:

1. Weight of nut including hull.
2. Width of shell at suture.
3. Width of shell 90 degrees to suture line (cross-suture).
4. Length of shell.
5. Kernel grade.
6. Weight of nut in-shell.

## ACREAGE

Estimated bearing acreage for 1992 is 179,000 acres. The acreage table 2 is a county summary of the data published in the 1991 California Fruit and Nut Acreage Bulletin. These numbers are preliminary and are subject to revision in the 1992 Fruit and Nut Acreage publication to be released in June of 1993.

TABLE 1 -- California English Walnut Acreage, Production, Price And Value In-Shell

Year	Bearing Acres a/	Total Production	Per Bearing Acre	Price Per Ton	Total Value
					Tons Dollars
1983	176,000	199,000	1.13	631.00	125,569,000
1984	178,000	213,000	1.20	730.00	155,490,000
1985	179,000	219,000	1.22	798.00	174,762,000
1986	180,000	180,000	1.00	1,080.00	194,400,000

a/ District and State averages are derived by weighting county averages by county bearing acreage figures.

b/ Coast includes: Alameda, Contra Costa, Lake, Monterey, Napa, San Benito, San Luis Obispo, Santa Clara and Sonoma counties.

c/ Sacramento Valley includes: Butte, Colusa, El Dorado, Glenn, Placer, Sacramento, Shasta, Solano, Sutter, Tehama, Yolo and Yuba counties.

d/ San Joaquin Valley includes: Fresno, Kern, Kings, Madera, Merced, San Joaquin, Stanislaus and Tulare counties.
