National Agricultural Statistics Service

ACKNOWLEDGMENT

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary and corresponding data for other citrus states are official estimates of the USDA, National Agricultural Statistics Service. Chilled and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetables, Florida Department of Agriculture and Consumer Services, were used in preparing production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, processors, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

This report was assembled under the direction of Jeffrey K. Geuder, Robert R. Terry, William C. Curtis, Candice T. Erick, and Rhonda L. Johnson of the Florida Agricultural Statistics Service.

FLORIDA CITRUS HARVESTING SEASON

TREE CENSUS

The Florida Agricultural Statistics Service first indexed the State's commercial citrus groves on aerial photography in January 1966. Ground crews update the information by identifying all the State's groves by fruit type, row spacing, and year in which set. Photo interpreters in the Orlando office then delineate the groves by variety blocks on photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The design of the inventory survey allows for quick and economical updating. Since 1966, the citrus belt has been re-surveyed each second winter to determine changes. Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography are obtained at a 1 to 30,000 scale.

The last statewide survey was conducted as of January 2004. Florida's citrus acreage, declining for most of the past decade, totals 748,555 acres. A net decrease of 48,748 acres, 6.1 percent, has occurred in the past two years. Plantings during 2002 and 2003 totaled 40,127 acres, but were outstripped by removals at a rate of over 2:1. This gross loss of 88,875 acres is the largest amount in a non-freeze survey period since the initial survey in 1966. Diseases such as tristeza, citrus canker, and the citrus root weevil have contributed to the loss. Total trees at 97.9 million are down 5.1 percent from the 103.2 million trees in 2002.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared using objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Productivity per tree is obtained from several objective fruit surveys including limb count, size, and droppage. Because of the statistical sampling design, counties with higher production in general have a greater number of samples and, therefore, estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are more reliable than for the individual counties.

FLORIDA CITRUS: Acres in commercial groves, as of January 1968-2004

Census Year	Acres	Percent change from	
		Previous survey	1966 survey
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	-6.7	+2.3

2003-04 SEASON HIGHLIGHTS

PRODUCTION

U.S. citrus production for the 2003-04 season was 8 percent above the 2002-03 season, but 8 percent lower than the record high production for the 1997-98 season. Florida accounted for 79 percent of the total U.S. citrus production; California totaled 18 percent, while Texas and Arizona produced the remaining 3 percent.

Florida's total production of 291.8 million boxes was an increase of 16 percent above the 2002-03 season and was higher for all varieties except the white grapefruit and tangelos. It was the highest production since the 1990-00 season total of 298.4 million boxes, and the fourth highest on record. The orange crop, at 242.0 million boxes was 19 percent greater than the previous season. Valencia orange production surpassed the previous season by 27 percent and early-midseason-Navel production was up 13 percent.

Grapefruit utilization in Florida, at 40.9 million boxes, was up 6 percent from the previous season. Production was higher for both early and late tangerines. Temple production was up 8 percent and the tangelo crop was at the lowest level since 1964-65.

Florida's citrus acreage totals 748,555 acres as of January 2004, a net decrease of 48,748 acres (6.1 percent) in the past two years. Acreage decreased for all orange categories except other early and other midseason oranges which include the newer varieties. Nearly 40 percent of the grapefruit acreage has been lost since the record set in 1994. The 2004 total is 16 percent lower than in 2002. Specialty citrus types decreased 15 percent since 2002. Temple acreage continues to decline and is down 25 percent. Acreage declined for the fourth time for Fallglo and Sunburst early tangerine varieties. Honey tangerine acreage is down less than 1.0 percent. Tangelo acreage decreased 13 percent. Lemon acreage increased 1.6 percent. The small quantities of Robinson and Dancy tangerines, limes, and K-Early Citrus are now included in other citrus.

California decreased utilized citrus production by 17 percent from the 2002-03 season. California's all orange production, at 52 million boxes, was 16 percent lower than the previous season. Grapefruit production, at 5.4 million boxes, was down 4 percent from the 2002-03 season.

Texas' utilized production of citrus was up 2 percent from the 2002-03 season. Orange production increased 5 percent from the previous season and grapefruit production was up 1 percent.

Arizona's total citrus production was up 7 percent from last season. Grapefruit utilized production was up 8 percent, while oranges and lemons were unchanged from the 2002-03 season.

VALUE

The U.S. citrus crop value for 2003-04 was up 4 percent from last season. Total value of production for 2003-04 was higher for all types of citrus, except lemons, tangelos, and Temples.

Florida's \$746.0 million preliminary value of the 2003-04 citrus crop is down 5.3 percent from the 2002-03 season's revised value of \$787.4 million.

Prices and values were lower for all orange varieties. Early-midseason-Navel value was down 24 percent, Valencia orange value was down 8 percent. Grapefruit price per box increased 27 percent and total value increased 34 percent.

Price per box and value for tangerines were lower for the early category (Fallglo and Sunburst) but higher for the Honey variety resulting in a lower price, but higher value for all tangerines. Temple on-tree price fell to the lowest since 1966-67 and equals only 53 percent of last season's value. The preliminary price for tangelos is higher than any revised price in the series and the crop value is up 20 percent from last season. Prices for the 2003-04 season are preliminary and will be revised next September when the results of all participation plans and pools become final.

FOREIGN EXPORTS

Fresh fruit exports totaled 23.4 million ⁴/_s-bushel cartons. Canada accounts for the majority of Florida orange and specialty fruit exports while Japan receives the most grapefruit. More details are listed on page 39.

FROZEN CONCENTRATE

A total of 19.7 million gallons of FCOJ was exported, mostly to Canada, and Florida exported 11.0 million gallons of FCGJ. FCOJ exports were almost twice as much as last year, and FCGJ exports were slightly more than one-and-a half times as much as last year.

The final FCOJ yield, reported by the Florida Citrus Processors Association, was higher this season for all oranges (1.55649), lower for early-midseason fruit (1.44560), and higher for late oranges (1.691555). The final tangerine yield (FCTJ) climbed to (1.52467) and the grapefruit yield (FCGJ) was up to (1.21591).

For fruit going into concentrate, the price per box was lower for all orange varieties and white grapefruit. For colored grapefruit, the price was higher. The price per pound of solids was lower for all varieties except colored grapefruit. All grapefruit ended out the same price per pound solids as the previous year.

FLORIDA CITRUS: Value of sales on-tree, crop years 1994-95 through 2003-04

Crop year	Value	Crop year	Value
	<i>1,000 dollars</i>		<i>1,000 dollars</i>
1994-95	948,173	1999-00	1,108,523
1995-96	1,075,817	2000-01	862,031

PRICING FLORIDA CITRUS

PRICES

All prices reported in this publication, except the concentrate prices in the table on page one, are on-tree prices representing the average price received by growers for their fruit. The term "on-tree" relates to fruit returns to the grower after the costs of picking, hauling, and packing have been removed. Prices are based on records of commercial fresh fruit sales and processed fruit returns.

Each season, beginning with the first month that at least three percent of a fruit type is harvested, monthly estimates are computed. Reports from fresh fruit sales organizations and from packers provide data for an average freight-on board (f.o.b.) price. Processors report an average spot and cash price for fruit delivered to their plants. From these values, an estimated charge for picking, hauling, and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales.

At the season's end, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price. A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together by varieties to determine the final processing price received by

growers. From this price, charges for picking, hauling, and packing, as estimated by University of Florida economists, are deducted to arrive at the final on-tree price received by growers. These preliminary figures for the season just ended, the revised figures for the previous season, and county production by type are released annually in late September.

PACKOUT RATES

Fresh prices shown in this publication are for "pure fresh" or 100% packout. Grading diverts a portion of the crop from fresh use. Returns at processing plants for this diverted fruit will generally be less than for field run fruit because of extra costs. In order to compare fresh prices shown in this publication to the individual grower's return it is necessary to calculate a derived price for that crop. Below is an example and a blank table for calculating fresh returns based on packout rates.

The example describes a delivery of 1,000 boxes with a packout rate of 60% (0.60 in decimal format). At this rate, 600 boxes (1,000 X 0.60) are shipped fresh at a price of \$9.50 per 1 3/5 bushel box equivalent. The remaining 400 boxes (1,000 X 0.40) are eliminations hauled to a processing facility and receive a price of \$1.20. The grower receives \$5,700.00 for the fresh portion and \$480.00 for the processed portion. Dividing the total amount of \$6,180.00 by the total of 1,000 boxes results in a derived price of \$6.18 per box.

SAMPLE CALCULATION OF GROWER'S RETURN

	Packout Rate		Prorated Boxes		On-tree Price		Amount Received	Derived Price
	Percent	Decimal						
Shipped Fresh	60	0.60	600	X	Fresh	\$9.50 =	\$5,700.00	
Eliminations	40	0.40	400	X	Processed	\$1.20 =	\$480.00	
Delivered to Packinghouse	100	1.00	1000				\$6,180.00	\$6.18

Shipped Fresh				X	Fresh	=		
Eliminations				X	Processed	=		
Delivered to Packinghouse								

2003-04 FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS, AND MONTHS

Year 2003 was brought in with pounding rains and thunderstorms, bringing four to six inches of moisture in a single day in some areas. Temperatures for the month of **January** dropped below freezing, but were not cold enough to cause any damage. Overall, the cold weather was beneficial to citrus by helping slow any new growth and keeping the trees semi-dormant for the remainder of the wintery period. Warmer temperatures in **February** spawned pinhead bloom buds, and new growth. Rain, combined with irrigating and warmer temperatures in most areas was ideal for the upcoming bloom period. Early-mid harvest was still active and harvest of Valencias was underway and beginning to pick up speed.

Trees were in relatively good condition in **March** and spring weather had arrived, bringing temperatures in the 70s and 80s for several weeks. By mid-March trees were in full bloom. Many caretakers continued to irrigate to maintain optimum tree condition, with virtually all trees showing new growth and development. Late March to early **April** transitioned from warm, wet weather to dry and hot. Temperatures throughout the month fluctuated, but the moist ground from rainfall earlier in the year and from irrigation kept the trees in good condition.

Early **May** was mostly warm and dry. With only average precipitation in most areas, afternoon leaf curl and wilt began occurring in many areas not well irrigated. Late May, rainfall picked up in some regions but did not cover the complete citrus area. Caretakers were busy mowing, chopping, and discing cover crops to help protect from grove fires. **June** reverted back to normal Florida summer weather patterns with numerous rain showers and thunderstorms. Fruit droppage was minimal as most trees had adjusted to the size crop they could carry to harvest. Rains carried on into mid-**July** and early **August**, stimulating growth and producing healthy looking trees with fruit looking healthy and sizing well. Continued hot, humid weather was supplemented during the middle of the month by heavy rain in all except the extreme northern citrus area.

In **September**, Tropical Storm Henri passed across the northern area of the citrus belt bringing the heaviest rainfall to the areas around Tampa to below Ft. Myers along the coast and inland from south of Lake Okeechobee northward. Growers maintained ditch middles to keep water moving away from the tree roots. The total summer rainfall was far above average going into the new citrus season. **October** began with cooler, dryer weather. Many low-lying groves were still experiencing wet, soggy grounds that needed to dry out. Lakes, ponds, and reservoirs were mostly full going into a much dryer time of year. Very little rainfall fell for the month and warm weather was prevalent the last weeks of October through the beginning of **November**.

Fall cultural practices included limited spray application in some groves with fresh fruit crops. Overall, groves, trees, and fruit were in good condition.

December rains came during the second week of the month in conjunction with a cold front that would move through the State and affect the rest of the year. Temperatures were in the upper 20s for short durations. No damage to leaves or fruit was reported. Trees were hearty and growers and packers were reporting good natural color and excellent external appearance on tangerines, early oranges, and grapefruit. Warm and unseasonably dry weather brought in the new year and lasted for most of the first week. Conditions for the rest of **January** indicated typical Florida winter weather. Temperatures were in the mid 30s at night and daytime highs were in the 60s and 70s. Some growers irrigated to maintain good tree condition and to encourage crop growth. Growers also began fertilizing in anticipation of new growth emerging in the spring.

February had a wide range of temperatures from as low as the mid 30s reaching to the 80s on some days. Rainfall was above average for the month throughout the citrus-producing counties. Groves and trees were in good condition for the bloom period. In early **March**, field workers reported feathery new growth and abundant bloom buds on oranges and grapefruit. Lower interior trees were in full bloom by the first of the month. Cultural practices included fertilization and hedging following harvest. The coldest spell of the winter had come and gone early in the season and Florida citrus trees were healthy and unaffected by any adverse conditions.

April was cool and dry. Growers with well cared for groves continued irrigating to maintain healthy trees to hold the next season's abundant crop. By the middle of the month, bloom was complete in all areas. Dry and warm weather throughout the month of **May** forced growers to continue irrigation. Most trees remained in good condition, while some young trees produced a lot of new growth. **June** started off with rains in much needed areas. Rain continued, producing a lot of new growth on mostly healthy looking trees. In **July**, growers and caretakers began focusing on the new season with hopes for another good year.

In the chart below, the 2003-04 monthly rainfall is compared to the historical average which includes data from two stations in each of the five citrus producing areas. The ten stations are: Avon Park (2 W), Arcadia, Clermont (7 S), Immokalee (3 NNW), Moore Haven Lock 1, Orlando (WSO McCoy), Plant City, Stuart (1 N), and Vero Beach (4 W), Winter Haven.

FLORIDA PRECIPITATION: Average monthly rainfall for the period of 1993-94 through 2002-03 and 2003-04

HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is a native of the Orient. From there it was carried ever westward by man, to India, to the Mediterranean, and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Hispaniola. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time.

Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest cultivated groves planted in Florida (Hume, 1926, p. 95) is thought to have been the Don Phillipe grove in Pinellas County, planted sometime between the years of 1809 and 1820. Nearly 1.5 million boxes were shipped in 1887-88, the first season on record. Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. In the 2003-04 season, Florida produced 291.8 million boxes representing 79 percent of the Nation's citrus production.

^{1/} Includes tangelos and Temples. K-Early Citrus Fruit included through 2001-02.

^{2/} 42.0 degrees Brix.

^{3/} Prior to 1996-97, canned and blended juice only. Since 1996-97 includes sections and salads, canned, fresh squeezed, and blends.

SOURCE: See Page 47, Data Sources, Item 3

^{4/} Freeze year.

^{5/} 40.0 degrees Brix.

^{6/} Used primarily in FCOJ.

BOXES OF FRUIT PER TREE

The Florida Agricultural Statistics Service conducts objective surveys to determine fruit per tree, average sizes, and droppage between August and maturity. These data are used to estimate production per tree for each type of citrus fruit, as shown in the following four tables.

The estimates of production per tree are based on official end-of-season production estimates and the number of bearing trees indicated by the citrus tree inventory surveys. The averages of boxes per tree for age groups

shown are calculated from estimates of fruit per tree in August, size at maturity, and drop between August and maturity.

Additionally, the boxes are subdivided by production areas. Estimated boxes by types and age groups are weighted averages of the indicated seasons. Small sample sizes in some age/area cells and rounding may contribute to inconsistent averages.

FLORIDA CITRUS: Estimated boxes of fruit per tree by age groups and production areas,
1999-00 through 2003-04

Fruit type and season	Area	Age of trees					Average, weighted by bearing trees
		3 - 5 years	6 - 8 years	9 - 13 years	14 - 23 years	24 years and older	

1999-00 through 2003-04

^{1/} Forecast.

^{2/} Crop years refers to harvest and marketing period, which usually begins in the fall and extends to the spring. This corresponds roughly to October-June in the Northern Hemisphere and April-December in the Southern Hemisphere. For the Southern Hemisphere, harvest occurs almost entirely during the second year shown.

^{3/} One metric ton is equivalent to 2,204.6 pounds.

^{4/} Includes Temples.

^{5/} Includes small quantities of tangerines.

^{6/} Mainly satsumas (also called mandarin or unshu mikan), but also including mandarin hybrids.

^{7/} Clementines only.

^{8/} Includes tangelos, which account for about half of the combined tangerine and tangelo production.
