ACKNOWLEDGMENT

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary and corresponding data for other citrus states are official estimates of the USDA's National Agricultural Statistics Service. Chilled and frozen pack statistics were compiled by the Florida Department of Citrus. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetables, Florida Department of Agriculture and Consumer Services, were used in preparing production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, processors, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

This report was assembled under the direction of James A. Ewing, Candice T. Erick, William C. Curtis, Michael S. Labbe, and Rhonda L. Ganzenmuller of the USDA/NASS/Florida Field Office.

FLORIDA CITRUS HARVESTING SEASON

COMMERCIAL CITRUS ACREAGE

This biennial inventory, the twenty-second in a series which began in January 1966, was conducted using digital imagery of peninsular Florida. Base maps are 2004 Digital Orthoimagery Quarter Quadrangles (DOQQ's) with newer high resolution imagery, provided by the Florida Resources and Environmental Analysis Center (FREAC), as available.

The 2008 total citrus acreage at 576,577 is the lowest since record keeping began with the 1966 tree inventory. Trees were removed due to urban development, canker, greening, and abandonment of non-productive groves. Also included in the reduction is two large areas being converted to reservoirs by a water management district.

Acreage decreases were recorded in 25 of the 30 counties included in the survey. Martin County suffered the greatest loss in acreage at 34 percent and is reduced by 11,869 acres. Hendry lost 9,799. Even with a loss of 5,023 acres, Polk continues to lead with 81,375. Hendry, Highlands, and DeSoto follow with over 60,000 acres each. Osceola and Hillsborough had substantial losses of almost 25 percent since the last census.

All orange acreage at 496,518 is the lowest since the 1986 census, when a record low of 466,252 remained following several major freezes. After a recovery period, acreage surpassed 600,000 in 1992 and remained above that level until the recent hurricanes beginning in 2004.

CITRUS BOX WEIGHTS: Approximate net weight by fruit type and states

State	Orange	Grapefruit	Tangerine	Lemon	Lime
<i>Pounds</i>					
FL	^{1/} 90	85	95	90	88
CA	75	67	75	76	--
TX	85	80	--	--	--
AZ	75	67	75	76	--

^{1/} Includes Temples and tangelos at 90 pounds.

Grapefruit acreage has fallen over 50 percent in only eight years to a new low of 56,881. The Indian River District, although devastated by losses to canker and urban development, has the highest inventory with almost three-fourths of the State total.

Specialty fruit acreage has continued to decline across the State and now stands at 23,178, less than one-fourth of the record 101,615 acres in 1970.

2008	576,577	-7.2	-32.8

2007-08 SEASON HIGHLIGHTS

PRODUCTION

U.S. citrus utilized production for the 2007-08 season is 13.0 million tons, up 24 percent from the 2006-07 season but 27 percent lower than the record high production of 17.8 million tons for the 1997-98 season. Florida accounted for 70 percent the total; California totaled 27 percent, and Texas and Arizona produced the remaining 3 percent.

Production of Florida citrus in the 2007-08 season is 203.8 million boxes, up 26 percent from the previous season. The primary reason for the increase is higher fruit per tree on all varieties. The average fruit per tree is 52 percent higher on early-midseason oranges (excluding Navels), and 59 percent higher on Valencias. The average fruit per tree on white grapefruit is the highest since the 1992-93 season, and on colored grapefruit higher than the previous three seasons.

The all orange crop production, at 170.2 million boxes is up 32 percent. Early-midseason-Navel orange production is up 27 percent, Valencia production had a 37 percent increase. All grapefruit production at 26.6 million boxes is 2.2 percent less than the 2006-07 season. Increases in production were recorded for all types of specialty fruit.

AREA AND COUNTY PRODUCTION

Total citrus production in 2007-08 was up in all Florida commercial citrus production areas from the 2006-07 season. The Central and Western areas had the largest gains with increases of 16.2 million and 10.8 million boxes.

Production in the top four counties increased by 33 percent. Together, they produced 50 percent of all citrus. Polk led with 31.0 million boxes, Hendry had 24.4 million boxes. Highlands followed closely with 24.1 million boxes, and DeSoto completed the four with 22.0 million boxes. Gains were recorded in 28 counties with only Hillsborough and Palm Beach producing less citrus.

Leading orange producers were Polk at 27.1 million boxes, followed by Highlands at 22.7 million boxes and Hendry at 22.5 million boxes. Desoto came in fourth again this season at over 21.6 million boxes. The four counties combined accounted for 55 percent of the State's total oranges. Indian River and St. Lucie far surpassed all other counties in grapefruit production, with nearly 18 million boxes combined. Together, they accounted for 67 percent of the State's grapefruit crop.

The Central area produced 39 percent of the State's tangerines and 37 percent of the tangelos. The Southern area produced the second highest specialty crop, accounting for 28 percent of the tangerines and 17 percent of the tangelos.

FLORIDA CITRUS: Value of sales on-tree, crop years 1997-98 through 2007-08

Crop year	Value	Crop year ^{1/}	Value
	1,000 dollars		1,000 dollars
1998-99	1,097,253	2003-04	891,500
1999-00	1,108,523	2004-05	754,169
2000-01	862,031	2005-06	1,024,610
2001-02	966,803	2006-07 ^{2/}	1,499,112
2002-03	787,378	2007-08 ^{3/}	1,211,939

^{1/} Excludes lemons beginning in 2003-04.

^{2/} Revised.

^{3/} Preliminary.

VALUE

The value of the 2007-08 U.S. citrus crop is up 2 percent from last season, to \$3.22 billion (packinghouse-door equivalent). Total value of production for 2007-08 is lower for the orange, tangelo, and grapefruit crops but higher for the lemon, tangerine and mandarin crop. Orange value of production decreased 4 percent, grapefruit value decreased 15 percent, and tangelo value is down 36 percent from the previous season. Tangerine and mandarin value of production increased 40 percent from last season, and lemon value of production increased 31 percent. Beginning with the 2006-07 season, Temple production and value are included in the early-mid-Navel component of Florida's orange estimates.

Florida's \$1.2 billion (on-tree equivalent) preliminary value of the 2007-08 citrus crop is down 19 percent from the 2006-07 season's revised record value crop of \$1.5 billion. The price per box and on-tree value of production is lower on all varieties. Tangelos suffered the largest decreases with price per box down 69 percent and value of production down 63 percent. The all orange price per box decreased 39 percent, tangerines are down 46 percent, but the grapefruit price per box is less than four percent lower.

Preliminary value is based on that part of the crop priced at harvest, which accounts for all of the fresh fruit and about 40 percent of the processed. Nearly one-half of the processed oranges were priced but the figure for processed grapefruit and tangerines is about one-quarter of the total.

FOREIGN EXPORTS

Fresh fruit exports totaled 14.8 million 4/5 bushel cartons. Japan accounted for the majority of Florida grapefruit. Canada received the most of Florida's orange and specialty fresh fruit exports. More details are listed on page 39.

A total of 10.1 million gallons of FCOJ (Frozen Concentrated Orange Juice), and 7.6 million gallons of FCGJ (Frozen Concentrated Grapefruit Juice) were exported in the 2007-08 season.

FROZEN CONCENTRATE

Final FCOJ yield, reported by the Florida Department of Citrus, set record highs for all oranges (1.67274 gallons per box) and late oranges (1.79034), but was lower than the previous season for early-midseason fruit (1.55335). The final tangerine yield (FCTJ) was up (1.47635) and the final grapefruit yield (FCGJ) was down (1.31020).

PRICED FRUIT: 2007-08 Season average delivered-in price for fruit used in concentrate by variety

Variety	Price per box	Price per pound of solids
	Dollars	
All oranges	8.76	1.32
Early-midseason	8.78	1.29
Valencia	9.49	1.35
All grapefruit	2.69	0.55
White	2.73	0.58
Colored	2.66	0.52

SOURCE: Florida Department of Citrus

PRICING FLORIDA CITRUS

PRICES

All prices reported in this publication, except the concentrate prices in the table on page one, are on-tree prices representing the average price received by growers for their fruit. The term "on-tree" relates to fruit returns to the grower after the costs of picking, hauling, and packing have been removed. Prices are based on records of commercial fresh fruit sales and processed fruit returns.

Each season, beginning with the first month that at least three percent of a fruit type is harvested, monthly estimates are computed. Reports from fresh fruit sales organizations and from packers provide data for an average freight-on board (f.o.b.) price. Processors report an average spot and cash price for fruit delivered to their plants. From these values, an estimated charge for picking, hauling, and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales.

At the season's end, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price. A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are

weighted together by varieties to determine the final processing price received by growers. From this price, charges for picking, hauling, and packing, as estimated by University of Florida economists, are deducted to arrive at the final on-tree price received by growers. The preliminary figures for the season are revised and released annually in late September.

PACKOUT RATES

Fresh prices shown in this publication are for "pure fresh" or 100% packout. Grading diverts a portion of the crop from fresh use. Returns at processing plants for this diverted fruit will generally be less than for field run fruit because of extra costs. In order to compare fresh prices shown in this publication to the individual grower's return it is necessary to calculate a derived price for that crop. Below is an example and a blank table for calculating fresh returns based on packout rates.

The example describes a delivery of 1,000 boxes with a packout rate of 60% (0.60 in decimal format). At this rate, 600 boxes (1,000 x 0.60) are shipped fresh at a price of \$9.50 per 1 3/5 bushel box equivalent. The remaining 400 boxes (1,000 x 0.40) are eliminations hauled to a processing facility and receive a price of \$1.20. The grower receives \$5,700.00 for the fresh portion and \$480.00 for the processed portion. Dividing the total amount of \$6,180.00 by the total of 1,000 boxes results in a derived price of \$6.18 per box.

SAMPLE CALCULATION OF GROWER'S RETURN

	Packout Rate		Prorated Boxes	On-tree Price	Amount Received	Derived Price
	Percent	Decimal				
Shipped Fresh	60	0.60	600 x Fresh	\$9.50 =	\$5,700.00	
Eliminations	40	0.40	400 x Processed	\$1.20 =	\$480.00	
Delivered to Packinghouse	100	1.00	1,000		\$6,180.00	\$6.18

CALCULATE YOUR RETURN

	Packout Rate		Prorated Boxes	On-tree Price	Amount Received	Derived Price

2007-08 FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS, AND MONTHS

With the exception of a short cold snap and light rainfall, **January 2007** was warm and dry. The complete citrus region was deficit of water with lakes and canals at low levels. Growers irrigated lightly to avoid stimulating new growth. Two cold snaps during the month of **February** changed the scene in the citrus region. The first cold front dropped temperatures to the low to mid 30s in all citrus areas. Strong winds in the upper part of the citrus region produced tornadoes and heavy rainfall. The second cold front came two weeks later. Cold pockets between 27 and 32 degrees were recorded in some citrus areas, but the duration was not long enough to cause any severe damage to the groves. Freeze-burned "flush" was reported to a minor extent, but did not affect the next season's crop. Looking back, the cold weather was beneficial in holding off what likely was going to be an early bloom. The bloom period finally set off the third week of **March**. Coastal and upper interior areas experienced a full, open bloom on most varieties, while a few of the Valencia orange groves began showing petal drop.

Two storm fronts pushed across the State during the second week of the **April**, bringing some needed rain to citrus producing areas. Rainfall during **May** was sparse most of the month. Lake Okeechobee reached a record low level. Water restrictions were put into place in many areas. By the end of the month, the State was facing one of the worst droughts since the collection of weather data began. During the first week of **June**, Tropical Storm Barry dumped up to four inches of rain in much of the State's citrus producing areas. Growers realized some relief from the vigorous irrigation schedules they had been maintaining all season. Typical summer patterns continued into **July** with afternoon thunderstorms. The trees responded with healthy new growth, and quality fruit. During **August**, high temperatures reached the mid 90s on several days during the month. Growers continued with robust irrigation programs to keep moisture on the trees and in the ground.

September and **October** had cooler mornings in conjunction with late afternoon and early evening rainstorms. **November** was warm, reaching the low to mid 80s on several days throughout the month. All areas were in need of more rainfall during this typically dry time of the year.

Temperatures were mostly warm throughout the month of **December**, and rainfall was inadequate.

In early **January 2008**, a cold snap dropped temperatures to the upper 20s and lower 30s across the citrus producing region. By the end of the month, with warming temperatures, daily highs were at least in the mid 70s. **February** had cool weather in the lower 30s. Light frost was reported on several mornings. In **March**, citrus growers enjoyed warming afternoons and beneficial rainfall. Early fertilizer applications were applied with irrigation to assist in tree growth and the fruit maturing process. Some growers hedged and topped trees after harvest to maintain a tree surface conducive to large size fruit for next season.

April temperatures were average, reaching the lower to mid 80s on most afternoons. No significant rainfall was reported after the first week of the month. Trees began to show slight afternoon wilt during the heat of the day. The bloom period finished during the first two weeks of the month, and the new fruit for next season formed quickly on the trees. **May** followed seasonal patterns, reaching the lower to mid 90s most days. Rainfall was not adequate enough to maintain tree vigor. Irrigation schedules continued at above normal rates.

Temperatures throughout the month of **June** reached the mid 90s regularly. Afternoon and evening rainfall was prevalent in all areas, assisting in fruit growth and helping the trees with the new foliage. During a few of the wettest periods, rainfall amounts were between 1½-2 inches in a single day. Excess amounts of rainfall were received when Tropical Storm Fay swept across the State twice during the month of **July**. Citrus producing counties along the East Coast had up to a foot of rain in a single week. Canals and lakes were mostly full and water was plentiful. Temperatures warmed during the month, again reaching the lower 90s on most days. Most citrus areas looked good, with growers and owners positive about the new citrus season.

In the chart below, the 2007-08 monthly rainfall is compared to the historical average data from two stations in each of the five citrus producing areas. The ten stations are: Apopka, Arcadia, Balm, Ft. Pierce, Immokalee, Labelle, Lake Alfred, Sebring, Umatilla, and Vero Beach.

HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is native to the Orient. From there it was carried ever westward by man, to India, to the Mediterranean, and across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, on his second voyage, he brought citrus seeds that were planted on the island of Hispaniola. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that then citrus fruits were grown in abundance around St. Augustine.

Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest cultivated groves planted in Florida (Hume, 1926, p. 95) is thought to have been the Don Phillipe grove in Pinellas County, planted sometime between the years of 1809 and 1820. Nearly 1.5 million boxes were shipped in 1887-88, the first season on record. Citrus production in Florida had reached a high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. The highest production ever was reached in the 1997-1998 season, when Florida produced 304.5 million boxes.

^{1/} Includes Tangelos and Temples. K-Early Citrus Fruit included through 2001-02.

^{2/} 42.0 degrees Brix.

SOURCE: See Page 47, Data Source 3 for 2004-05 and earlier, Data Source 5 beginning in 2005-06.

^{3/} Prior to 1996-97, canned and blended juice only. Since 1996-97 includes sections and salads, canned, fresh squeezed, and blends. Tangerines may include chilled.

^{4/} 40.0 degrees Brix.

^{5/} Used primarily in FCOJ.

ORANGES: Utilization, season average on-tree price, and value by types, by states,
crop years 2003-04 through 2007-08 ^{1/}

BOXES OF FRUIT PER TREE

The Florida Agricultural Statistics Service conducts objective surveys to determine fruit per tree, average sizes, and droppage between August and maturity. These data are used to estimate production per tree for each type of citrus fruit, as shown in the following four tables.

The estimates of production per tree are based on official end-of-season production estimates and the number of bearing trees indicated by the citrus tree inventory surveys. The

averages of boxes per tree for age groups shown are calculated from estimates of fruit per tree in August, size at maturity, and drop between August and maturity.

Additionally, the boxes are subdivided by production areas. Estimated boxes by types and age groups are weighted averages of the indicated seasons. Small sample sizes in some age/area cells and rounding may contribute to inconsistent averages.
