

FLORIDA AGRICULTURAL STATISTICS

INVENTORY OF COMMERCIAL CITRUS ACREAGE 1984

FLORIDA DEPARTMENT OF AGRICULTURE
AND CONSUMER SERVICES
DOYLE CONNER, COMMISSIONER

FLORIDA CROP AND LIVESTOCK
REPORTING SERVICE

DIVISION OF PLANT INDUSTRY

Richard P. Small, Statistician in Charge

Salvatore A. Alfieri, Jr. (Ph D), Director

ACKNOWLEDGMENT

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production. In addition, they recognized the need to maintain citrus tree and acreage inventories on a current basis in the future.

The work was directed by the Florida Crop and Livestock Reporting Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Crop and Livestock Reporting Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. These contributions are sincerely appreciated.

This public document was promulgated at a cost of \$1.76 per copy to the State of Florida. It is published to inform citrus growers and others of trends in Florida citrus production. M84T6

**AERIAL PHOTOGRAPHY
 COVERAGE OF THE
 FLORIDA CITRUS PRODUCTION AREA**

GENERAL DESCRIPTION OF THE SURVEY

SUMMARY

The acreage of commercial citrus in Florida decreased considerably since the 1982 census. There are now 761,365 acres compared to 847,856 in 1982. This is the smallest total acreage since the early 1960's when the citrus acreage was reduced considerably by the 1962 freeze and plantings in the southern parts of the citrus belt were still on the drawing boards.

The gross loss of 159,719 acres during the past two years was partially offset by new plantings of 73,228 acres in the same period, for a net loss of 86,491 acres. The new plantings of 73,228 acres were the largest of any two year planting since the 87,077 acres reported in January 1968.

Largest increases in total citrus acreage occurred in Highlands, Hendry, St. Lucie, Charlotte, Glades, Okeechobee, Indian River, DeSoto, Collier and Hardee counties. The largest decreases in those counties where the regular tree census was completed were in Osceola, Pinellas, Palm Beach, Dade, Martin, Lee and Broward counties.

SAMPLE SURVEY OF THE UPPER INTERIOR AND UPPER WEST COAST

Tree damage and loss in the Upper Interior and upper West Coast areas was so widespread and severe that a census of all groves which have changed since the 1982 census could not possibly be completed in time for a 1984 report of citrus acreage. Furthermore, the status of most trees still living will not be finally known in 1984. As of the census survey period, it was possible, in these severely damaged areas, only to tell if a tree was alive. In order to update tree acreage and numbers for these areas as of June, a probability sample of about 6,800 citrus plantings was selected. This was a little over 10 percent of all the individual citrus age variety plantings standing, in the sampled areas in the 1982 citrus census. Each planting selected represented an individual planting of one variety and age. Each such unit included in the sample was checked on the ground and a determination made on the percent of trees still living. Any tree with green foliage in the limb scaffold was considered alive unless the planting could be considered totally abandoned for lack of care.

Upper Interior area counties included in this sample survey were Alachua, Flagler, Lake, Marion, Orange, Putnam, St. Johns, Seminole, Sumter and Volusia. West Coast area counties sampled were Citrus, Hernando, Hillsborough and Pasco.

Estimates resulting from the sample are the numbers of acres and trees living which were also present in the previous 1982 census. Thus it was also necessary to project the number of acres and trees planted in 1982 and 1983 still standing in June 1984. These projections utilized actual plantings in the Lower Interior and East Coast areas which in recent censuses have comprised over 80 percent of Florida citrus plantings. Thus a total of 1982 and 1983 plantings was extrapolated for the sampled areas, then reduced at the same loss rates as found for 1981 and older plantings in the sampled areas.

The sample of 1981 and older block plantings is stratified according to variety and age, to eliminate sampling variability due to differences between these strata. The temporal status of trees in the sampled areas is a more important criterion for accuracy of the estimates than is the sampling variability. The sample results will not produce reliable county data and will be used only for estimating district totals of all citrus in this report, and district totals by type, variety and year planted.

The sample estimator and its approximate variance for each variety-age stratum are:

$$\hat{Y} = R \sum X_i$$

$$V(\hat{Y}) = \frac{N-n}{n} N [S_Y^2 + R^2 S_X^2 - 2RS_{XY}]$$

$$R = \frac{\sum Y_i}{\sum X_i} : \text{ratio for stratum, where } Y_i = R_i X_i$$

n : Number of sample plantings in stratum

N : Number of population plantings in stratum

\hat{Y} : Estimated acres or trees in one age-variety class or stratum

R_i : Live trees 1984 as percent of trees 1982 in i th sample planting

X_i : Trees 1982 in i th sample planting

Y_i : Trees 1984 in i th sample planting

S_Y^2 : Variance of Y

S_X^2 : Variance of X

S_{XY} : Covariance of X and Y

The estimates and variances at the district level are the sum of Y and $V(Y)$ over each of the variety strata.

The statistical errors resulting from the sampling procedure are shown below as a percent of the combined estimates made for the sampled districts and for the State:

| | Combination of Estimate and Census | Relative Error Due to Sampling |
|----------------|--|--------------------------------------|
| | 1,000 trees | Percent |
| Upper Interior | 10,901 | 1.4 |
| West Coast | 5,574 | 1.6 |
| State Total | 65,976 | 0.3 |

NON-PHOTOGRAPHED AREAS

Flight lines are laid out for maximum grove coverage at minimum cost. Since it is not economically feasible to photograph approximately 1,000 scattered acres of outlying citrus, supplemental photography was purchased, where available. In the absence of photography, the outlying acreage was mapped and thoroughly checked by ground survey teams.

For quality control and to locate any newly established groves, a light airplane was used to strip fly those areas of the citrus belt not actually photographed.

PHOTO INTERPRETATION

Stereoscopic views enabled interpreters to examine two photo contact prints simultaneously, to detect changes in groves occurring during 1982 and 1983. Altered ground characteristics result in loss of three-dimensional effect, making such changes as new groves, additions to existing groves, pushed groves, and other significant alterations quickly identifiable. In addition to stereo examination, a light table was used to visually compare replacement cronaflex enlargements with the previous master transparencies on which groves are delineated.

GROVE INDEXING

Following field inspection, photo interpreters delineated and indexed all new citrus groves and grove changes by variety blocks on cronaflex enlargements of aerial photographs. Polar planimeters were used to measure acres of new and altered citrus

groves. Tree numbers were computed from the combination of acreage measurements and tree spacing as measured by fieldmen. All statistical information - variety, year set, acreage, tree numbers and identifying features - was then keyed into a computer system and retained for future use.

There are approximately 170,000 variety blocks, all of which were summarized by computer and retained on magnetic tape. Printed tables came off the computer as camera-ready copy, all accomplished with a minimum clerical staff.

COMMERCIAL GROVES, MINIMUM 50 TREES

The data in this report relate to commercial groves, those containing a minimum of 50 trees from which fruit is generally sold. In addition, the grove must have been cultivated and, if cold damaged, have viable growth in the limb scaffold.

NET ACRES IN COMMERCIAL GROVES

The acreage shown is that land which is actually planted with citrus trees. Bayheads, ponds, sink-holes, drainage canals, lateral and swale ditches, roads, turn rows and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage was then reduced to equivalent net acres of commercial trees. These groves will be revisited every two years to determine acreage reset.

CHRONOLOGICAL AGE USED

Trees are listed by the calendar "year in which set," even though they may have been severely pruned. Grove managers' records were used, when available, to establish age. Age of young trees is estimated from both trunk circumference and tree height.

RESET TREES

The photo interpreters send ground crews to all groves where there appear to be new trees. If the inspector finds new trees in the grove and they constitute a significant percent of a variety block, a count is made and the older trees reduced accordingly. The measured block acreage is then divided between the two ages of trees, based on this on-site count of trees.

INTERSET AND MULTI RESET BLOCKS

In blocks of citrus which are interset, acreage is proportionate to the number of trees of each variety or type, and/or age in the block. In the multi reset blocks two or more resets are planted for each tree removed in one direction. Because the distance between trees in that direction is reduced by more than one half, the spacing for the block must be averaged. The spacing in the other direction remains constant for grove travel.

UNIDENTIFIED TREES

Identification of citrus varieties is generally dependent on presence of fruit. Many young groves visited for the first time are necessarily indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "unidentified" will be resurveyed and classified by variety in the next census.

The unidentified trees and acres are listed by year set and by county under all Florida citrus. They are also included in the all orange, all grapefruit and all citrus totals shown by county and year set.

MISCELLANEOUS CITRUS

Data itemized under the heading of miscellaneous citrus include minor types and varieties, such as Honey tangerines, lemons, limes, Ponkans, Satsumas, K-Early Citrus, Kumquats, Calamondines, etc. Most of the miscellaneous acreage and trees are identified at the state level in the variety summary

tables of all citrus. They are not reported by year set within county due to lack of space.

ZERO ACRES AND TREES

The various tables in this report were summarized and printed using a computer. Variety totals were computer rounded to the nearest acre and one hundred trees. All item totals that fell below these parameters were listed as zeros. For this reason, users are cautioned that zero cells in the data tables could actually have a positive entry, but would be less than one-half acre and below 50 trees.

PLANT INDUSTRY ASSISTANCE

Much of the credit for the success of this survey goes to the Division of Plant Industry, which supplies eight trained citrus technologists with 4-wheel drive vehicles to work exclusively on tree census for more than seven consecutive months. Fieldmen from the objective survey crew of the Crop Reporting Service completed the work assignment team.

POST SURVEY TREE COUNTING

The badly frozen Upper Interior and upper West Coast citrus groves are in need of recounting. Many thousands of acres and trees have been pushed, abandoned, or reset whenever trees were available for replanting. The recent citrus canker discovery temporarily stopped most in-grove survey work. It was still a question, at the time of this report, just when tree census could resume on a routine basis.
