Joe E. Mullin, Statistician In Charge
Orlando, Florida

DIVISION OF PLANT INDUSTRY

Halwin L. Jones, Director
Gainesville, Florida

ACKNOWLEDGEMENTS

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production. In addition, they recognized the need to maintain citrus tree and acreage inventories on a current basis in the future.

Use of aerial photography in the survey was developed in part with U. S. Department of Agriculture matching funds under the Agricultural Marketing Act of 1946, and resources of U. S. D. A.'s Statistical Reporting Service.

The work was directed by the Florida Crop and Livestock Reporting Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Crop and Livestock Reporting Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. The Growers Protective Division of Florida Citrus Mutual, county sheriffs, and county agricultural agents helped expedite field checking. These contributions are sincerely appreciated.

EXPLANATION OF CITRUS ACREAGE INVENTORY AS OF DECEMBER 1967

UPDATING FLORIDA'S CITRUS ACREAGE INVENTORY

This publication establishes the fact that once an accurate citrus acreage inventory is recorded on aerial photographs, it can be brought up to date in a short time.

In December 1965, the Florida Crop and Livestock Reporting Service began indexing citrus groves on current aerial photography. Photo interpretation and field checking covered 20 percent of all Florida's land surface. By March 1, 1967, Florida's citrus industry was given a more comprehensive and current citrus acreage inventory than at any time in its history. The inventory included details by county, variety, and year in which set. That initial report, prepared as of December 1965, was designed to be updated quickly and economically.

This report is the second complete inventory updated to December 1967. It required 8 months of intensive effort using new aerial photographs, comparative photo interpretation, and the field checking and cataloguing of changes disclosed on photographs. This application of proven technology to an agricultural problem has provided current data indicating Florida's potential for future citrus production within a shorter period of time than has ever been achieved anywhere in a survey of comparable difficulty and scope -- and at substantially less cost than ground survey methods alone.

AERIAL PHOTOGRAPHY

Abrams Aerial Survey Corporation of Lansing, Michigan, the low bidder, was awarded the contract to rephotograph flight lines established in 1965. The firm provided 12,000 square miles of photography containing 99.1 percent coverage of commercial citrus in Florida.

Ninety percent of the area was photographed in a 4 week period beginning the second week in November. The remainder was flown in late January.

STEREOSCOPIC EXAMINATION

Using large F-71 stereoscopic viewers with binoculars to examine two contact prints, simultaneously, it was possible to quickly detect changes occurring between 1965 and 1967. Altered ground characteristics resulted in loss of third dimensional effect, making it possible to detect such changes as new groves, additions to existing groves, pushed groves, and other significant alterations.

FIELD INSPECTION

In mid-December 1967 field crews began ground checking new photography in areas questioned by the photo interpreters. Most of the field time was consumed indexing new groves set since the last survey. But, in addition, any alteration in previously surveyed groves was recorded on ozalid copies of aerial photos for correction upon return to the office. The inspectors checked for resets in all blocks that had excessive vacancies in 1965. They also identified varieties of many blocks unidentified in the 1965 summary. The small portion of acreage that was not economically feasible to photograph was completely rechecked by field inspectors. Four-wheel drive vehicles were used to accomplish ground checking that was completed by late May in just over six months time.

GROVE INDEXING

Following field inspection, photo interpreters indexed new blocks of fruit on the enlarged aerial photographs. Polar planimeters were used to measure new and changed acreage. Tree numbers were computed from these measurements and tree spacing measured by field men. All the statistical information, variety, year set, acreage, tree numbers, and other features were recorded on punch cards and summarized on EAM equipment.

NON-PHOTOGRAPHED AREAS

Flight lines were very carefully laid out for maximum grove coverage with minimum photos and all commercial citrus was photographed, except about 8,400 acres that were not economically feasible to include. This 8,400 acres was thoroughly checked by ground survey teams.

A light airplane was employed to strip fly all areas in the entire citrus belt not actually photographed to locate any newly established groves.

NET ACRES IN COMMERCIAL GROVES

The data in this report relate to groves containing a minimum of 50 trees and being maintained for commercial production.

The acreage shown is that actually planted to trees. Bayheads, ponds, sink holes, drainage canals and laterals, swale ditches, roads, turn rows, and wide middles were excluded. Where vacancies within a commercial grove were excessive, they have been counted and acreage adjusted downward to net acres of commercial trees. These groves will automatically be revisited every two years to determine acreage reset.

CHRONOLOGICAL AGE USED

Data are listed by "year in which set". This relates to the year in which the acreage or trees were set. Age of older trees was estimated based on trunk circumference, and young trees from both trunk circumference and height. Grove manager records were used where available.

UNIDENTIFIED TREES

Identification of citrus varieties is dependent on presence of fruit. Many young groves enumerated for the first time were necessarily indexed as unidentified until fruit is available for identification. Acreage and trees in this report listed as "unidentified" will be resurveyed and reported in the next census.

USE OF EXISTING ENLARGEMENTS

Based on pilot work conducted between flights, it was decided that cronaflex enlarge-

ments used in the original survey could be utilized where changes in grove character were just nominal. This involved a considerable savings in dollar outlay and valuable time necessary to transfer block indexing to new enlargements. In the event there was significant change in the two year lapse, replacements were ordered. Enlargements, of course, were purchased in all newly photographed areas.

QUALITY CONTROL

To maintain complete reliability, one photograph in each eight was randomly drawn to be rechecked in the field. Questions asked by the photo interpreters were reviewed by supervisory personnel. In one of the photographed sections, a thorough ground check was done to determine if photo interpreters may have over looked any grove changes.

ADDITIONAL SURVEY WORK

The Division of Plant Industry is continuing its disease and injurious insect detection program. In this activity a systematic sample of groves is visited and inspectors record changes and essential statistical information on tree populations. During the period between the 1965 and 1967 census about one-half of all the photographs were field checked. It is anticipated that the remaining half can be ground checked before time for the next flight at the end of 1969.

In addition, Florida Crop and Livestock Reporting Service personnel are engaged in continuing survey work. Refinement in old records of existing groves and recording of new groves is resulting from these activities.

This office fully intends to provide the Florida citrus industry with a new and updated census through use of aerial photography as long as it is advisable and funds are budgeted to cover the expenses. With use of techniques developed from the experiences of two complete surveys using aerial photography and minimum ground checking, cost is only a fraction of what it would be if only ground checking methods were used.
