Gainesville, Florida

ACKNOWLEDGEMENTS

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production. In addition, they recognized the need to maintain citrus tree and acreage inventories on a current basis in the future.

Use of aerial photography in the survey was developed in part with U. S. Department of Agriculture matching funds under the Agricultural Marketing Act of 1946, and resources of U. S. D. A. 's Statistical Reporting Service.

The work was directed by the Florida Crop and Livestock Reporting Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Crop and Livestock Reporting Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. The Growers Protective Division of Florida Citrus Mutual, county sheriffs, and county agricultural agents helped expedite field checking. These contributions are sincerely appreciated.

This public document was promulgated at a cost of \$1.80 per copy to the State of Florida. It is published to inform citrus growers and others of trends in Florida citrus production.

This publication is provided free upon request.

CITRUS ACREAGE INVENTORY AS OF DECEMBER 1971

SUMMARY

This publication presents the results of the fourth biennial survey of Florida citrus trees using aerial photography. The use of aerial photography and interpretation of that photography allows a survey to be conducted much quicker than with any other method, although about 8 months of intensive efforts are required to process and review photographs. Changes in groves are detected by comparative photo interpretation, followed by field checks of new and altered acreages. Changes disclosed on photographs and in field observations are used to update earlier inventories. This application of proven technology to an agricultural problem provides current data for evaluating Florida's potential for citrus production within a shorter period of time and at less cost than by ground survey methods alone.

The Florida Crop and Livestock Reporting Service first began indexing citrus groves on aerial photography in December 1965. By March 1, 1967, the State's first comprehensive citrus acreage inventory was completed. The inventory report included detailed data by county, variety, and year set. The 1965 inventory survey was designed for quick and economical updating. The second inventory, by use of photography was conducted as of December 1967, and a third as of December 1969.

AERIAL PHOTOGRAPHY

The same three mile wide flight lines established in 1965 were photographed on each of the succeeding flights. The area was photographed at a scale of 1 to 30,000 and covers approximately 13,000 square miles. The area covered by these flight lines includes better than 99 percent of the commercial citrus acreage in Florida.

Photographing for the 1971 survey began in November 1971 and was completed in March 1972. An unusually mild winter produced near continuous daytime cloud formations. Clear, cloudless days were few and an extended period was required to complete aerial photographing.

PHOTO INTERPRETATION

The use of F-71 stereoscopic viewers with binoculars to examine two contact prints simultaneously, enabled interpreters to detect changes in groves occurring between 1969 and 1971. Altered ground characteristics result in loss of third dimensional effect, making such changes as new groves, additions to existing groves, pushed groves, and other significant alterations quickly identifiable.

In addition to stereo examination, a double panel light table was used to visually compare replacement cronaflex enlargements with the oldmaster cronaflexes on which groves are delineated. This effective method of determining changes in groves will be used even more for future surveys.

FIELD INSPECTION

In January 1972, field crews began ground checking points on the new photography questioned by photo interpreters. All blocks that had excessive vacancies in 1969 were checked for resets. Crews identified varieties in blocks of citrus containing trees too young to identify in earlier surveys. Scattered acreage outside the flight lines was completely rechecked by field inspectors. Field work was completed in early August 1972.

GROVE INDEXING

Following field inspection, photo interpreters delineated and indexed new blocks of fruit on enlarged aerial photographs. Polar planimeters were used to measure new and changed citrus acreage. Tree numbers were computed from the combination of these measurements and tree spacing measured by field men. All statistical information, including variety, year set, acreage, tree numbers, and other identifying features, were recorded on punch cards.

There are approximately 175,000 variety blocks, all of which are summarized on automatic data processing equipment via magnetic

tapes. Printed tables come off the computer as camera ready copy, all accomplished with a minimum clerical staff.

NON-PHOTOGRAPHED AREAS

Flight lines are laid out for maximum grove coverage at minimum cost. It was not economically feasible to photograph approximately 3,000 scattered acres of citrus. These acres were mapped and thoroughly checked by ground survey teams.

A light airplane was used to strip fly all areas of the citrus belt not actually photographed, to locate any newly established groves.

TREES SET IN 1970 and 1971

The data in this report relate to groves containing a minimum of 50 trees being maintained for commercial production. A count is also made of new reset trees in old groves where they constitute 10 percent or more of a variety block. Acreage is then prorated accordingly. New trees enumerated in 1970 and 1971 fall in one of these categories.

NET ACRES IN COMMERCIAL GROVES

The acreage shown is that actually planted to trees. Bayheads, ponds, sink holes, drainage canals, lateral and swale ditches, roads, turn rows, and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage adjusted downward to equivalent acres of commercial trees. These groves will be revisited every two years to determine acreage reset.

CHRONOLOGICAL AGE USED

Data are listed by "year in which set". This relates to the year in which the trees were set in the grove. Grove managers' records were used when available to establish age. Otherwise, age of older trees was estimated based on trunk circumference. Ages of young trees were estimated from both trunk circumference and height.

INTERSET AND MIXED ACREAGE

In blocks of citrus which were interset, acreage was prorated proportionately by the ratio of trees of each variety or type and/or age to total acreage. Groves that are thoroughly mixed because of more than one age or type of trees were also prorated by this method. Small blocks and those with substantial variation have been classed as mixed and added to the other citrus category.

UNIDENTIFIED TREES

Identification of citrus varieties is dependent on presence of fruit. Many young groves visited for the first time are necessarily indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "unidentified" will be re-surveyed and reported in the next census.

FREEZE DAMAGED GROVES

In the winter of 1970-71, midway between the 1969 and 1971 surveys, there was a series of cold waves which hit along the West Coast and in colder locations of the interior of the citrus belt. There was considerable freeze loss in these areas and some additional abandonment by growers.

For this survey, field crews were instructed to consider as non-commercial those groves that fell in the following categories: (1) totally dead; (2) groves that the owner personally declared abandoned; (3) groves with serious freeze damage, that had not been pruned or cultivated at the time of the survey; (4) groves with serious damage that had received only minimal care and the inspectors deemed not economically feasible to maintain.

YOUNG TREE DECLINE

In areas where young tree decline is prevalent, principally along the lower portion of the citrus belt, special emphasis was given to groves with excessive vacancies. Anytime 10 percent of a variety block had died or been removed, reset or otherwise altered, field men were dispatched to determine the extent of loss and to enumerate the change.
