DIVISION OF PLANT INDUSTRY

R. A. McGregor, Statistician in Charge  
Orlando, Florida

Halwin L. Jones, Director  
Gainesville, Florida

### ACKNOWLEDGMENTS

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production. In addition, they recognized the need to maintain citrus tree and acreage inventories on a current basis in the future.

The work was directed by the Florida Crop and Livestock Reporting Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Crop and Livestock Reporting Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. These contributions are sincerely appreciated.

This public document was promulgated at a cost of \$1.80 per copy to the State of Florida. It is published to inform citrus growers and others of trends in Florida citrus production.

# CITRUS ACREAGE INVENTORY AS OF DECEMBER 1973

## SUMMARY

This publication presents the results of the fifth biennial survey of Florida citrus trees using aerial photography. The use of aerial photography and photo interpretation provides for completion of a survey more rapidly than with any other method; even then, about eight months of intensive effort is required to process and review photographs. Changes in groves are detected by comparative photo interpretation, followed by field checking of new and altered acreages. Changes disclosed on photographs and in field observations are used to update the previous inventory. This application of proven technology provides current tree inventory data for evaluating Florida's potential citrus production within a shorter period of time and at less cost than by ground survey methods alone.

The Florida Crop and Livestock Reporting Service first began indexing citrus groves on aerial photography in December 1965. The inventory report included detailed data by county, variety, and year set. The 1965 inventory survey was designed for quick and economical updating. Subsequent surveys, using aerial photography, were conducted as of December 1967, 1969, 1971, and the latest for 1973.

## AERIAL PHOTOGRAPHY

The same three-mile wide flight lines established in 1965 were photographed on each of the succeeding flights. The area, photographed at a scale of 1 inch to 2,500 feet, covers approximately 13,000 square miles. The area covered by these flight lines includes about 99 percent of the commercial citrus acreage in Florida. Photographing for the 1973 survey began in November 1973 and was completed in a 90-day period.

## PHOTO INTERPRETATION

The use of stereoscopic viewers, with binoculars to examine two contact prints simultaneously, enabled interpreters to detect changes in groves occurring between 1971 and 1973. Altered ground characteristics result in loss of third-dimensional effect, making such changes as new groves, additions to existing groves, pushed groves, and other significant alterations quickly identifiable. In addition to stereo examination, a double-panel light table was used to visually compare replacement cronaflex enlargements with the previous master cronaflexes on which groves are delineated.

## FIELD INSPECTION

In January 1974, field crews began ground checking sites on the new photography questioned by photo interpreters. All blocks with excessive vacancies in 1971 were checked for re-sets. Crews also identified varieties in blocks of citrus containing trees too young to identify in earlier surveys. Field work was completed on July 12, 1974.

## GROVE INDEXING

Following field inspection, photo interpreters delineated and indexed all new citrus groves and grove changes by variety blocks on cronaflex enlarged aerial photographs. Polar planimeters were used to measure new and altered citrus groves. Tree numbers were computed from the combination of acreage measurements and tree spacing as measured by fieldmen. All statistical information - variety, year set, acreage, tree numbers, and other identifying features - was then keypunched.

There are approximately 170,000 variety punch cards, all of which were summarized on

automatic data processing equipment using magnetic tape. Printed tables came off the computer as camera-ready copy, all accomplished with a minimum clerical staff.

#### NON-PHOTOGRAPHED AREAS

All flight lines are laid out for maximum grove coverage at minimum cost. Since it is not economically feasible to photograph approximately 3,000 scattered acres of outlying citrus, supplemental photography was purchased, where available. In the absence of photography, the outlying acreage was mapped and thoroughly checked by ground survey teams.

For quality control and to locate any newly established groves, a light airplane was used to strip fly all areas of the citrus belt not actually photographed.

#### COMMERCIAL GROVES, MINIMUM 50 TREES

The data in this report relate to commercial groves containing a minimum of 50 trees. In addition, the grove must have been cultivated and, if cold damaged, have been pruned since the previous 1971 survey.

#### NET ACRES IN COMMERCIAL GROVES

The acreage shown is that land which is actually planted to trees. Bayheads, ponds, sink holes, drainage canals, lateral and swale ditches, roads, turn rows, and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage was then reduced to equivalent net acres of commercial trees. These groves will be revisited every two years to determine acreage reset.

#### CHRONOLOGICAL AGE USED

Data are listed by "year in which set." This relates to the calendar year in which the trees were set in the grove. Grove managers' records were used, when available, to estab-

lish age. Otherwise, age of older trees was estimated based on trunk circumference. Age of young trees is estimated from both trunk circumference and height.

#### RESET TREES

The photo-interpreters send ground crews to all groves where there appear to be new reset trees. If the inspector finds a sizeable number of new trees in a particular location in the grove or if resets constitute 10 percent or more of a variety block, a count is made and the older trees reduced accordingly.

#### INTERSET AND MIXED ACREAGE

In blocks of citrus which are interset, acreage is prorated proportionately by the ratio of trees of each variety or type, and/or age to total acreage. Groves that are thoroughly mixed because of more than one age or type of tree are also prorated by this method. Some small blocks with substantial variation have been classed as mixed and added to the other citrus category.

#### UNIDENTIFIED TREES

Identification of citrus varieties is often dependent on presence of fruit. Many young groves visited for the first time are necessarily indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "unidentified" will be re-surveyed and classified by variety in the next census.

The unidentified trees are classified as either orange or grapefruit for this report. They are shown on pages 6 through 17 only by year set and county. However, on pages 18 through 129, they are listed by fruit type, year set and county under all orange, or all grapefruit, and also all citrus. No attempt is made to prorate these unidentified data by variety. Users are cautioned to note this acreage, principally non-bearing, when totaling county statistics by variety and year set.

## TANGELOS ALL INCLUSIVE

Tree numbers for tangelos in this summary and previous biennial reports include some varieties no longer classified as tangelos by the citrus industry. The K-Early, Lee, Page, Seminole and Osceola citrus fruits have been grouped with tangelos due to incomplete varietal identification.

A resurvey of all mandarin and hybrid variety blocks set since the early sixties was undertaken in the late summer of 1974, when trees had fruit available for correct variety indexing. A supplemental specialty fruit report will be issued as soon as the data has been summarized. This will show the inventory of these new mandarin and hybrid varieties by year set.

## MISCELLANEOUS CITRUS

Data itemized under the heading of miscellaneous citrus on pages 122 through 129 includes minor types and varieties, such as lemons, limes, ponkans, satsumas, King oranges, Kumquats, and Calamondins. Miscellaneous acreage and trees are totaled in the eight tables of all citrus on pages 18 through 25. They are not reported by county and year set due to lack of space.

The only miscellaneous variety with a sizeable acreage which is not reported separately is satsumas. Survey records show there are 1,413 acres of satsumas with 131,100 trees, most of which are in the bearing age category.

## ZERO ACRES AND TREES

The various tables in this report were summarized and printed using a computer. All variety cards were computer rounded to the nearest acre and one hundred trees. All item totals that fell below these parameters were listed as zeros. For this reason, users are cautioned that zero cells in the data tables could actually have a positive entry, but would be less

than one-half acre and below 50 trees.

## YOUNG TREE DECLINE

In areas where young tree decline is prevalent, principally along the East Coast district of the citrus belt, special emphasis was given to groves with excessive vacancies. Whenever 10 percent of a variety block was dead, removed, reset or otherwise altered, fieldmen were dispatched to determine the extent of loss and to enumerate the change.

Additional grove information was recorded on numbers of trees set as resets and intersets versus new groves. Also, removals were indexed by total grove attrition versus commercial development. A special report on these statistics will be issued at a later date.

## PLANT INDUSTRY ASSISTANCE

Much of the credit for the success of this survey goes to the Division of Plant Industry. Their eight-man team of survey specialists in 4-wheel drive vehicles spent more than six months in the field and conducted a large part of the ground checks. Fieldmen from the objective survey crew of the Crop Reporting Service also completed a large work assignment. No part-time or otherwise untrained fieldmen were used for ground inspection.

## POST SURVEY RESEARCH

Between surveys, research will be conducted into better methods of enumerating and reporting changes that are occurring within commercial groves. Particular emphasis will be placed on the method of counting vacancies and resets below the 10 percent vacancy rule currently in effect.

As noted earlier, more complete reporting on the minor mandarin and hybrid varieties should be possible when these blocks are rechecked by variety.
