

FLORIDA AGRICULTURAL STATISTICS

INVENTORY OF COMMERCIAL CITRUS ACREAGE AS OF JANUARY 1980

FLORIDA DEPARTMENT OF AGRICULTURE
AND CONSUMER SERVICES
DOYLE CONNER, COMMISSIONER

FLORIDA CROP AND LIVESTOCK
REPORTING SERVICE

DIVISION OF PLANT INDUSTRY

Richard P. Small, Statistician in Charge

Halwin L. Jones, Director

ACKNOWLEDGMENT

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production. In addition, they recognized the need to maintain citrus tree and acreage inventories on a current basis in the future.

The work was directed by the Florida Crop and Livestock Reporting Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Crop and Livestock Reporting Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. These contributions are sincerely appreciated.

This public document was promulgated at a cost of \$1.33 per copy to the State of Florida. It is published to inform citrus growers and others of trends in Florida citrus production. M80T20

**AERIAL PHOTOGRAPHY
 COVERAGE OF THE
 FLORIDA CITRUS PRODUCTION AREA**

GENERAL DESCRIPTION OF THE SURVEY

SUMMARY

This publication presents the results of the eighth biennial survey of Florida citrus trees using aerial photography. The use of aerial photography and photo interpretation provides for completion of a survey more rapidly than with any other method; even then, about eight months of intensive effort is required to process and review photographs. Changes in groves are detected by comparative photo interpretation, followed by field checking of new and altered acreages. Changes disclosed on photographs and in field observations are used to update the previous inventory. This application of proven technology provides current tree inventory data for evaluating Florida's potential citrus production within a shorter period of time and at less cost than by ground survey methods alone.

The Florida Crop and Livestock Reporting Service first began indexing citrus groves on aerial photography with the January 1966 survey. The 1966 inventory report included detailed data by county, variety, and year set, and the survey was designed for quick and economical updating. Subsequent surveys, using aerial photography, were conducted as of January every two years including the latest for 1980.

Citrus acreage in Florida increased for the first time since 1970. There were 845,283 acres of commercial citrus in Florida as of January 1, 1980. The results from the latest tree census survey show a net increase of 1.7 percent from 831,235 acres reported for the previous census on January 1, 1978. Much of this increase in acreage is due to the intensive expansion of existing groves; to borders, resets and intersets planted in groves that have continued to suffer tree losses from normal attrition, young tree decline and effects of the 1977 freeze. Also, some younger groves that had previously been classed as abandoned have been reworked and are now productive.

Largest acreage increases occurred in St. Lucie, Martin, Desoto, Indian River, Glades, Hardee and Collier counties. The five counties that lost the most acreage were Polk, Broward, Pinellas, Orange and Lake in that order.

ACREAGE CHANGE REPORT

The Crop and Livestock Reporting Service classifies acreage changes occurring between surveys. These reports, initiated in 1974, describe acreage loss for various attrition factors by fruit types and by counties. The latest report was released in November, 1980 and may be obtained upon request.

AERIAL PHOTOGRAPHY

The same three-mile wide flight lines established for the January 1966 survey were photographed on each of the succeeding flights, with some progressively additional coverage as citrus acreage has become more dispersed. The area, photographed at a scale of 1 inch to 2,500 feet, now covers approximately 14,000 square miles, and includes more than 99 percent of the commercial citrus acreage in Florida. Photographing for the 1980 survey began in November 1979 and was completed in February 1980.

NON-PHOTOGRAPHED AREAS

Flight lines are laid out for maximum grove coverage at minimum cost. Since it is not economically feasible to photograph approximately 1,000 scattered acres of outlying citrus, supplemental photography was purchased, where available. In the absence of photography, the outlying acreage was mapped and thoroughly checked by ground survey teams.

For quality control and to locate any newly established groves, a light airplane was used to strip fly those areas of the citrus belt not actually photographed.

PHOTO INTERPRETATION

The use of stereoscopic viewers to examine two photo contact prints simultaneously, enabled interpreters to detect changes in groves occurring during 1978 and 1979. Altered ground characteristics result in loss of third-dimensional effect, making such changes as new groves, additions to existing groves, pushed

groves, and other significant alterations quickly identifiable. In addition to stereo examination, a double-panel light table was used to visually compare replacement transparent cronaflex enlargements with the previous master transparencies on which groves are delineated.

FIELD INSPECTION

On January 4, 1980, field crews began ground checking sites on the new photography questioned by photo interpreters. All blocks with excessive vacancies since 1978 were checked for resets. Crews also identified varieties in blocks of citrus containing trees too young to identify in earlier surveys. Field work was completed the first of August.

GROVE INDEXING

Following field inspection, photo interpreters delineated and indexed all new citrus groves and grove changes by variety blocks on cronaflex enlarged aerial photographs. Polar planimeters were used to measure acres of new and altered citrus groves. Tree numbers were computed from the combination of acreage measurements and tree spacing as measured by fieldmen. All statistical information - variety, year set, acreage, tree numbers, and identifying features - was then keyed into a computer system and placed on magnetic tape.

There are approximately 200,000 variety cards, all of which were summarized by computer and retained on magnetic tape. Printed tables came off the computer as camera-ready copy, all accomplished with a minimum clerical staff.

COMMERCIAL GROVES, MINIMUM 50 TREES

The data in this report relate to commercial groves, those containing a minimum of 50 trees from which fruit is generally sold. In addition, the grove

must have been cultivated and, if cold damaged, have been pruned in a reasonable time.

NET ACRES IN COMMERCIAL GROVES

The acreage shown is that land which is actually planted with citrus trees. Bayheads, ponds, sink holes, drainage canals, lateral and swale ditches, roads, turn rows, and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage was then reduced to equivalent net acres of commercial trees. These groves will be revisited every two years to determine acreage reset.

CHRONOLOGICAL AGE USED

Trees are listed by the calendar "year in which set." Grove managers' records were used, when available, to establish age. Age of young trees is estimated from both trunk circumference and tree height.

RESET TREES

The photo interpreters send ground crews to all groves where there appear to be new trees. If the inspector finds new trees in the grove and they constitute a significant percent of a variety block, a count is made and the older trees reduced accordingly. The measured block acreage is then prorated between the two ages of trees, based on this on-site count of trees.

INTERSET AND MIXED ACREAGE

In blocks of citrus which are interset, acreage is prorated proportionate to the number of trees of each variety or type, and/or age in the block. Groves that are thoroughly mixed because of more than one age or type of tree are also prorated by this method. Some small blocks with substantial variation have been classed as mixed and added to the other citrus category.

UNIDENTIFIED TREES

Identification of citrus varieties is generally dependent on presence of fruit. Many young groves visited for the first time are necessarily indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "unidentified" will be resurveyed and classified by variety in the next census.

The unidentified trees are shown on pages 1 through 16 only by year set and county. However, on pages 17 through 128, they are listed by fruit type, year set and county under all orange, or all grapefruit, and also all citrus. No attempt is made to prorate these unidentified data by variety. Users are cautioned to note this acreage, principally non-bearing, when totaling county statistics by variety and year set.

MISCELLANEOUS CITRUS

Data itemized under the heading of miscellaneous citrus on pages 121 through 128 include minor types and varieties, such as lemons, limes, Ponkans, Satsumas, K-Early citrus, Kumquats, Calamondines, etc. Most of the miscellaneous acreage and trees are identified at the state level in the variety summary tables of all citrus on pages 1 through 16. They are not reported by year set within county due to lack of space.

ZERO ACRES AND TREES

The various tables in this report were summarized and printed using a computer. Variety totals were computer rounded to the nearest acre and one hundred trees. All item totals that fell below these parameters were listed as zeros. For this reason, users are cautioned that zero cells in the data tables could

actually have a positive entry, but would be less than one-half acre and below 50 trees.

PRE-1977 YEAR SET INCREASES

Many of the groves that were ground checked for change have had loss of trees and accompanying resets for several years, but just reached a significant volume to justify recounting. When these young resets are counted, they are often given an average age, which explains why there may be an increase in the pre-1977 year set in some counties since the previous report.

PLANT INDUSTRY ASSISTANCE

Much of the credit for the success of this survey goes to the Division of Plant Industry, which supplies eight trained citrus technologists with 4-wheel drive vehicles to work exclusively on tree census for more than seven consecutive months. Fieldmen from the objective survey crew of the Crop Reporting Service completed the work assignment team.

POST-SURVEY RESEARCH

The area of emphasis between flights will be on procedures for proper treatment of the accelerated rate of individual tree replacement due primarily to more intensive culling practices but also due to tree decline. This is the most difficult area of the system, in concept and in operations, and especially for cost-effective operations. There will be increasing dependency on the Division of Plant Industry staff of fieldmen assigned to field checking in the course of their ongoing grove inspections for diseases and insects.
