ACKNOWLEDGMENT

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production. In addition, they recognized the need to maintain citrus tree and acreage inventories on a current basis in the future.

The work was directed by the Florida Crop and Livestock Reporting Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Crop and Livestock Reporting Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. These contributions are sincerely appreciated.

This public document was promulgated at a cost of \$1.60 per copy to the State of Florida. It is published to inform citrus growers and others of trends in Florida citrus production.

GENERAL DESCRIPTION OF THE SURVEY

SUMMARY

This publication presents the results of the sixth biennial survey of Florida citrus trees using aerial photography. The use of aerial photography and photo interpretation provides for completion of a survey more rapidly than with any other method; even then, about eight months of intensive effort is required to process and review photographs. Changes in groves are detected by comparative photo interpretation, followed by field checking of new and altered acreages. Changes disclosed on photographs and in field observations are used to update the previous inventory. This application of proven technology provides current tree inventory data for evaluating Florida's potential citrus production within a shorter period of time and at less cost than by ground survey methods alone.

The Florida Crop and Livestock Reporting Service first began indexing citrus groves on aerial photography in December 1965. The inventory report included detailed data by county, variety, and year set. The 1965 inventory survey was designed for quick and economical updating. Subsequent surveys, using aerial photography, were conducted as of December 1967, 1969, 1971, 1973, and the latest for 1975.

AERIAL PHOTOGRAPHY

The same three-mile wide flight lines established in 1965 were photographed on each of the succeeding flights. The area, photographed at a scale of 1 inch to 2,500 feet, covers approximately 14,000 square miles. The area covered by these flight lines includes about 99 percent of the commercial citrus acreage in Florida. Photographing for the 1975 survey began in November 1975 and was completed in a 90-day period.

PHOTO INTERPRETATION

The use of stereoscopic viewers, with binoculars to examine two contact prints simultaneously, enabled interpreters to detect changes in groves occurring between 1973 and 1975. Altered ground characteristics result in loss of third-dimensional effect, making such changes as new groves, additions to existing groves, pushed groves, and other significant alterations quickly identifiable. In addition to stereo examination, a double-panel light table was used to visually compare replacement cronaflex enlargements with the previous master cronaflexes on which groves are delineated.

FIELD INSPECTION

On January 5, 1976, field crews began ground checking sites on the new photography questioned by photo interpreters. All blocks with excessive vacancies in 1973 were checked for re-sets. Crews also identified varieties in blocks of citrus containing trees too young to identify in earlier surveys. Field work was completed on July 21, 1976.

GROVE INDEXING

Following field inspection, photo interpreters delineated and indexed all new citrus groves and grove changes by variety blocks on cronaflex enlarged aerial photographs. Polar planimeters were used to measure new and altered citrus groves. Tree numbers were computed from the combination of acreage measurements and tree spacing as measured by fieldmen. All statistical information - variety, year set, acreage, tree numbers, and other identifying features - was then keypunched.

There are approximately 175,000 variety punch cards, all of which were summarized on

automatic data processing equipment using magnetic tape. Printed tables came off the computer as camera-ready copy, all accomplished with a minimum clerical staff.

NON-PHOTOGRAPHED AREAS

All flight lines are laid out for maximum grove coverage at minimum cost. Since it is not economically feasible to photograph approximately 2,000 scattered acres of outlying citrus, supplemental photography was purchased, where available. In the absence of photography, the outlying acreage was mapped and thoroughly checked by ground survey teams.

For quality control and to locate any newly established groves, a light airplane was used to strip fly all areas of the citrus belt not actually photographed.

COMMERCIAL GROVES, MINIMUM 50 TREES

The data in this report relate to commercial groves containing a minimum of 50 trees. In addition, the grove must have been cultivated and, if cold damaged, have been pruned in a reasonable time.

NET ACRES IN COMMERCIAL GROVES

The acreage shown is that land which is actually planted to trees. Bayheads, ponds, sink holes, drainage canals, lateral and swale ditches, roads, turn rows, and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage was then reduced to equivalent net acres of commercial trees. These groves will be revisited every two years to determine acreage reset.

CHRONOLOGICAL AGE USED

Data are listed by "year in which set." This relates to the calendar year in which the trees were set in the grove. Grove managers' records were used, when available, to estab-

lish age. Otherwise, age of older trees was estimated based on trunk circumference. Age of young trees is estimated from both trunk circumference and height.

RESET TREES

The photo-interpreters send ground crews to all groves where there appear to be new reset trees. If the inspector finds a sizeable number of new trees in a particular location in the grove or if resets constitute a significant percent of a variety block, a count is made and the older trees reduced accordingly.

INTERSET AND MIXED ACREAGE

In blocks of citrus which are interset, acreage is prorated proportionately by the ratio of trees of each variety or type, and/or age to total acreage. Groves that are thoroughly mixed because of more than one age or type of tree are also prorated by this method. Some small blocks with substantial variation have been classed as mixed and added to the other citrus category.

UNIDENTIFIED TREES

Identification of citrus varieties is often dependent on presence of fruit. Many young groves visited for the first time are necessarily indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "unidentified" will be re-surveyed and classified by variety in the next census.

The unidentified trees are classified as either orange or grapefruit for this report. They are shown on pages 1 through 16 only by year set and county. However, on pages 17 through 128, they are listed by fruit type, year set and county under all orange, or all grapefruit, and also all citrus. No attempt is made to prorate these unidentified data by variety. Users are cautioned to note this acreage, principally non-bearing, when totaling county statistics by variety and year set.

HYBRID VARIETIES IDENTIFIED

Since the last survey all hybrid and mandarin variety blocks set since the early sixties were rechecked for variety identification. In the classification of tangelos, all acres and trees of the non-classified varieties, K-Early, Lee, Osceola and Page citrus fruit, were removed, leaving only the recognized tangelo varieties. Consequently, the data reported in this summary are not completely comparable to the previous biennial report. A detailed distribution of varieties by year set is shown on pages 3 and 7.

Tangerine data was identified as either Dancy or Robinson varieties and reported on pages 3 and 7 for year set. Distribution by counties is shown on pages 11 and 15.

MISCELLANEOUS CITRUS

Data itemized under the heading of miscellaneous citrus on pages 121 through 128 includes minor types and varieties, such as lemons, limes, ponkans, satsumas, K-Early citrus, Kumquats, Calamondins, etc. Miscellaneous acreage and trees are totaled in the summary tables of all citrus on pages 1 through 16. They are not reported by year set within county due to lack of space.

ZERO ACRES AND TREES

The various tables in this report were summarized and printed using a computer. Variety summary cards were computer rounded to the nearest acre and one hundred trees. All item totals that fell below these parameters were listed as zeros. For this reason, users are cautioned that zero cells in the data tables could actually have a positive entry, but would be less than one-half acre and below 50 trees.

YOUNG TREE DECLINE

In areas where young tree decline and sand hill decline are prevalent, special empha-

sis was given to groves with excessive changes. Whenever a significant percent of a variety block was dead, removed, reset or otherwise altered, fieldmen were dispatched to determine the extent of loss and to enumerate the change.

Additional grove information was recorded on numbers of trees set as resets and inter-sets versus new groves. Also, removals were indexed by total grove attrition versus commercial development. A special report on these statistics will be issued at a later date.

1973 YEAR SET INCREASES

Many of the groves that were ground checked for change have had loss of trees and accompanying resets for several years, but just reached a significant volume to justify recounting. When these young resets are counted, they are given an average age, which explains why there may be an increase in the 1973 year set in some counties since the previous report.

PLANT INDUSTRY ASSISTANCE

Much of the credit for the success of this survey goes to the Division of Plant Industry. Their eight-man team of survey specialists in 4-wheel drive vehicles spent more than six months in the field and conducted a large part of the ground checks. Fieldmen from the objective survey crew of the Crop Reporting Service also completed a large work assignment. No part-time or otherwise untrained fieldmen were used for ground inspection.

POST-SURVEY RESEARCH

Between surveys, research will be conducted into better methods of enumerating and reporting changes that are occurring within commercial groves. Particular emphasis will be placed on the method of identifying and counting vacancies and resets. A test flight line will be flown using false color infrared film to aid in this research.
