ACKNOWLEDGMENT

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production. In addition, they recognized the need to maintain citrus tree and acreage inventories on a current basis in the future.

The work was directed by the Florida Crop and Livestock Reporting Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Crop and Livestock Reporting Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. These contributions are sincerely appreciated.

This public document was promulgated at a cost of \$1.25 per copy to the State of Florida. It is published to inform citrus growers and others of trends in Florida citrus production. M78T11

**AERIAL PHOTOGRAPHY
 COVERAGE OF THE
 FLORIDA CITRUS PRODUCTION AREA**

GENERAL DESCRIPTION OF THE SURVEY

SUMMARY

This publication presents the results of the seventh biennial survey of Florida citrus trees using aerial photography. The use of aerial photography and photo interpretation provides for completion of a survey more rapidly than with any other method; even then, about eight months of intensive effort is required to process and review photographs. Changes in groves are detected by comparative photo interpretation, followed by field checking of new and altered acreages. Changes disclosed on photographs and in field observations are used to update the previous inventory. This application of proven technology provides current tree inventory data for evaluating Florida's potential citrus production within a shorter period of time and at less cost than by ground survey methods alone.

The Florida Crop and Livestock Reporting Service first began indexing citrus groves on aerial photography with the January 1966 survey. The 1966 inventory report included detailed data by county, variety, and year set, and the survey was designed for quick and economical updating. Subsequent surveys, using aerial photography, were conducted as of January 1968, 1970, 1972, 1974, 1976 and the latest for 1978.

The census shows loss of trees from the mid-January 1977 freeze was not nearly as great as from other freezes of like severity. The lateness of the freeze and the dormant condition of the trees probably account for the lighter loss. The greatest loss occurred among sick or declining trees.

During the calendar years 1976 and 1977 there was a reduction of 49,127 equivalent acres of commercial groves. This was a gross loss of 5.8 percent from the 852,369 acres as of January 1976. The gross loss between the previous two survey flights was 4.6 percent. The losses were only partially offset by the addition of 27,993 acres of new trees set during the two year period. This is about the same level of setting that has been reported from each of the last few flights.

ACREAGE CHANGE REPORT

The Crop and Livestock Reporting Service continues the practice initiated in 1974 and repeated in 1976 to publish a report classifying the acreage changes which have occurred between surveys. These reports describe acreage loss for various attrition factors by fruit types and counties.

AERIAL PHOTOGRAPHY

The same three-mile wide flight lines established for the January 1966 survey were photographed on each of the succeeding flights, with some progressively additional coverage as citrus acreage has become more dispersed. The area, photographed at a scale of 1 inch to 2,500 feet, now covers approximately 14,000 square miles, and includes more than 99 percent of the commercial citrus acreage in Florida. Photographing for the 1978 survey began in November 1977 and was completed in January 1978.

NON-PHOTOGRAPHED AREAS

Flight lines are laid out for maximum grove coverage at minimum cost. Since it is not economically feasible to photograph approximately 1,000 scattered acres of outlying citrus, supplemental photography was purchased, where available. In the absence of photography, the outlying acreage was mapped and thoroughly checked by ground survey teams.

For quality control and to locate any newly established groves, a light airplane was used to strip fly all areas of the citrus belt not actually photographed.

PHOTO INTERPRETATION

The use of stereoscopic viewers, with binoculars to examine two photo contact prints simultaneously, enabled interpreters to detect

changes in groves occurring during 1976 and 1977. Altered ground characteristics result in loss of third-dimensional effect, making such changes as new groves, additions to existing groves, pushed groves, and other significant alterations quickly identifiable. In addition to stereo examination, a double-panel light table was used to visually compare replacement transparent cronaflex enlargements with the previous master transparencies on which groves are delineated.

FIELD INSPECTION

On January 3, 1978, field crews began ground checking sites on the new photography questioned by photo interpreters. All blocks with excessive vacancies in 1976 were checked for resets. Crews also identified varieties in blocks of citrus containing trees too young to identify in earlier surveys. Field work was completed on July 21, 1978.

GROVE INDEXING

Following field inspection, photo interpreters delineated and indexed all new citrus groves and grove changes by variety blocks on cronaflex enlarged aerial photographs. Polar planimeters were used to measure acres of new and altered citrus groves. Tree numbers were computed from the combination of acreage measurements and tree spacing as measured by fieldmen. All statistical information - variety, year set, acreage, tree numbers, and identifying features - was then keypunched.

There are approximately 150,000 variety punch cards, all of which were summarized by computer and retained on magnetic tape. Printed tables came off the computer as camera-ready copy, all accomplished with a minimum clerical staff.

COMMERCIAL GROVES, MINIMUM 50 TREES

The data in this report relate to commercial groves, those containing a minimum of 50 trees from which fruit is generally sold. In addition, the grove must have been cultivated and, if cold damaged, have been pruned in a reasonable time.

NET ACRES IN COMMERCIAL GROVES

The acreage shown is that land which is actually planted to trees. Bayheads, ponds, sink holes, drainage canals, lateral and swale ditches, roads, turn rows, and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage was then reduced to equivalent net acres of commercial trees. These groves will be revisited every two years to determine acreage reset.

CHRONOLOGICAL AGE USED

Trees are listed by the calendar "year in which set." Grove managers' records were used, when available, to establish age. Age of young trees is estimated from both trunk circumference and tree height.

RESET TREES

The photo-interpreters send ground crews to all groves where there appear to be new reset trees. If the inspector finds new trees in the grove and they constitute a significant percent of a variety block, a count is made and the older trees reduced accordingly. The measured block acreage is then prorated between the two ages of trees, based on this on-site count of trees.

INTERSET AND MIXED ACREAGE

In blocks of citrus which are interset, acreage is prorated proportionate to the number

of trees of each variety or type, and/or age in the block. Groves that are thoroughly mixed because of more than one age or type of tree are also prorated by this method. Some small blocks with substantial variation have been classed as mixed and added to the other citrus category.

UNIDENTIFIED TREES

Identification of citrus varieties is generally dependent on presence of fruit. Many young groves visited for the first time are necessarily indexed as unidentified until fruit is available for variety determination. Acreage and trees in this report listed as "unidentified" will be resurveyed and classified by variety in the next census.

The unidentified trees are shown on pages 1 through 16 only by year set and county. However, on pages 17 through 128, they are listed by fruit type, year set and county under all orange, or all grapefruit, and also all citrus. No attempt is made to prorate these unidentified data by variety. Users are cautioned to note this acreage, principally non-bearing, when totaling county statistics by variety and year set.

MISCELLANEOUS CITRUS

Data itemized under the heading of miscellaneous citrus on pages 121 through 128 include minor types and varieties, such as lemons, Limes, ponkans, satsumas, K-Early citrus, Kumquats, Calamondines, etc. Most of the miscellaneous acreage and trees are identified at the state level in the variety summary tables of all citrus on pages 1 through 16. They are not reported by year set within county due to lack of space.

ZERO ACRES AND TREES

The various tables in this report were summarized and printed using a computer. Variety

summary cards were computer rounded to the nearest acre and one hundred trees. All item totals that fell below these parameters were listed as zeros. For this reason, users are cautioned that zero cells in the data tables could actually have a positive entry, but would be less than one-half acre and below 50 trees.

1975 YEAR SET INCREASES

Many of the groves that were ground checked for change have had loss of trees and accompanying resets for several years, but just reached a significant volume to justify recounting. When these young resets are counted, they are often given an average age, which explains why there may be an increase in the 1975 year set in some counties since the previous report.

PLANT INDUSTRY ASSISTANCE

Much of the credit for the success of this survey goes to the Division of Plant Industry. Their eight-man team of survey specialists in 4-wheel drive vehicles spent more than six months in the field and conducted a large part of the ground checks. Fieldmen from the objective survey crew of the Crop Reporting Service completed the remainder of the work assignment. No part-time or otherwise untrained fieldmen were used for ground inspection.

POST-SURVEY RESEARCH

The area of emphasis will be on procedures for proper treatment of the accelerated rate of individual tree replacement due primarily to more intensive culling practices but also due to tree decline. This is the most difficult area of the system, in concepts and in operations, and especially for cost-effective operations. There will be increasing dependency on the Division of Plant Industry staff of fieldmen assigned to field checking in the course of their ongoing grove inspections for disease and insects.
