ACKNOWLEDGEMENTS

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Marketing Bureau Section and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Canners Association and the National Canners Association. Where data are from other sources, appropriate footnotes appear.

Records of the Citrus and Vegetable Inspection Division of the Florida Department of Agriculture were employed in production and utilization estimates. The Growers Administrative Committee assisted in developing production estimates.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contribution is sincerely appreciated.

Publications Committee,

CITRUS SUMMARY

PRODUCTION

Florida's citrus groves came into the 1970-71 harvest season in excellent condition, bearing record large crops. On October 10 the orange crop forecast was set at 168,000,000 boxes, 28.5 million above the previous record crop in 1966-67. Grapefruit was also estimated at a record level - 49,000,000 boxes, 5.4 million above the 1966-67 bumper crop. Set of fruit on tree for the 1970-71 season increased just nominally from the previous season, but sharp increases in bearing trees, coupled with anticipated larger fruit sizes and less than normal fruit drop, pointed to this record crop. Soil moisture was generally below average, and supplemental irrigation became necessary in the fall. Early maturity tests give indications of good internal quality and yield. Pounds of solids were slightly above average with juice not far behind. On December 10, after machine settings were announced, the season's yield was forecast to be 1.32 gallons of FCOJ per box.

On November 25, an early cold front brought freezing temperatures and heavy frost to all agricultural areas, except the Lower East Coast. Heavy fruit and wood loss occurred in central Hillsborough County where temperatures dipped to the low 20's for a long duration.

A severe freeze occurred January 20th and 21st, with minimum temperatures in upper teens covering the same areas as the November freeze. The Citrus Commission imposed an embargo on fresh fruit shipments for 7 days from January 25 to February 1. The Crop Reporting Service conducted a survey of round oranges to determine the extent of internal damage based on fruit cuts. The survey indicated that 56 percent of the State's early and midseason fruit unharvested as of February 2 and 3 had some cold damage. It showed that 33 percent of the late oranges had varying degrees of internal damage. The survey confirmed greatest damage was again to fruit in the West Coast area.

On March 10, after the freeze damage had been evaluated, the estimated yield factor was reduced to 1.21 fallons of FCOJ per box. Final tabulation by the Florida Cannery Association showed a final yield was in fact 1.21 gallons of 45° BRIX concentrate per box for all oranges, off only slightly, from the 1.24 yield in 1969-70. The industry used 103,521,000 boxes of oranges to produce a near record 125,187,000 gallons of frozen concentrate, in spite of adverse weather conditions.

The 1971 spring came somewhat later than normal and was still dry. Aided by irrigation and determined growers, tree recovery was satisfactory in most areas. Only along the West Coast was serious wood loss evident. Fruit blossoming was late and spotty in those areas of greatest damage. An orange tree loss survey was conducted during August and September, indicating 6 percent of bearing trees counted in the latest census were either killed or abandoned. Most of the loss was in trees less than 15 years old. There was a significant difference in loss by areas - West Coast had 22 percent loss; Upper Interior counties, 5 percent; Lower Interior counties, 3 percent; down to no loss along the Indian River.

In the face of all these adversities, the citrus industry produced the largest crop ever, a near record volume of processed products, and returned an above average value of sales. Weather in 1970-71 was reflected in a drop in production in the 1971-72 season.

California groves were generally in good condition as the 1970-71 season began. Fruit set was considered lighter than normal in most areas. Freezing temperatures hit the producing areas several times during the winter but fruit loss was nominal. Early spring conditions with above normal rainfall were conducive to good development. Production for the season was generally comparable to the previous season. The Navel crop

was down somewhat, but was practically offset by an increase in Valencia oranges.

Texas' harvest of both oranges and grapefruit began in September. Soil moisture which had been adequate earlier became critical during the winter months, and use of irrigation was essential to maintain fruit development. Less than 4 inches of rainfall were recorded during the 7 winter and spring months. However, production of both oranges and grapefruit was up from the 1969-70 season.

Arizona's bloom and set of fruit was generally heavy for all varieties for the 1970-71 crop. New growth was abundant as the result of summer rains. A severe freeze hit the production area the first week of January, causing moderate defoliation. Damage to fruit was varied, the most noticeable effect being the diversion of fruit from fresh use to processing plants. A second freeze hit in early March causing additional damage to those trees flushing out from the earlier freeze.

AERIAL PHOTOGRAPHY

The fourth biennial flight of citrus groves was begun in November 1971. A report is scheduled for release by mid-summer of 1972. Data from that flight will be available for objective fruit surveys in 1972-73.

PRICES

Based on cash sales, the on-tree value of Florida's 1970-71 citrus crop returned 17 percent more total dollars than the 1969-70 crop, which was revised to reflect final payments from cooperatives and fruit under participation contracts. Valencia oranges contributed most of the increased value, 75 percent above the previous year. Early and midseason fruit suffered heaviest fruit damage and value of sales was down.

Demand for grapefruit continues to be strong. Value of sales for the 1970-71 season was the largest ever for Florida - \$71,747,000, 14 percent above the 1969-70 crop. Per box values for both years were almost identical. The increased value of sales is totally related to increased boxes.

VALUE

Florida, All Citrus: Value of Sales, On-Tree Crop Years
1961-62 through 1970-71

Year	Value	Year	Value
1961-62	\$ 248,267,000	1966-67	\$ 177,049,000
1962-63	248,170,000	1967-68	305,775,000
1963-64	333,440,000	1968-69	284,509,000
1964-65	271,848,000	1969-70 1/	243,045,000
1965-66	223,435,000	1970-71 2/	284,571,000

1/ Revised. 2/ Preliminary.

NOTE - Net contents of box varies. The Florida citrus code defines an equivalent standard box of fruit as 90 pounds for oranges, Temples, Tangelos, Murcotts, and Lemons. Weight for Limes is 80 pounds, grapefruit is 85 pounds, and 95 pounds for Tangerines. Texas average weights are 90 pounds for oranges and 80 pounds for grapefruit. California weight averages are: oranges, 75 pounds; grapefruit, 65 pounds; lemons, 76 pounds. Arizona average weights are: oranges 75 pounds; grapefruit, 64 pounds; lemons, 76 pounds.
