U. S. Department of Agriculture  
Agricultural Marketing Service and  
Statistical Reporting Service

### **Acknowledgments**

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Bureau of Market News and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Cannery Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services were employed in production and utilization estimates. The Growers Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of Paul E. Shuler and Robert R. Terry of the Florida Crop and Livestock Reporting Service, and E. F. Scarborough, Bureau of Market News.

## CENTRAL FLORIDA

The winter season of 1974-75 continued the trend of relatively mild and dry weather established over the last several years. Several cold fronts penetrated the state during November, but none brought any significant cold weather. A series of cold fronts during the first three weeks of December brought the coldest weather of the season with minima occurring at most stations on the 4th and 10th. January and February consisted of alternating periods of very warm weather with afternoon highs in the 80's and brief cold spells with a minima mainly in the 30's. After the first week of March there were many days of above normal temperatures interrupted by cold fronts which merely brought temperatures to near normal for several days. Rainfall was below normal.

**NOVEMBER:** The season began relatively mild and dry until a cold front passed through the region on the morning of the 12th. Minimum temperatures on the 13th were mainly in the 40's. Another front swept through the state on the 20th. The center of the high remained well to the west until the 22nd; by the 23rd, winds were calm and most temperatures fell into the mid to upper 30's. A weak cold front passed through the state on the 27th. Total rainfall ranged from 1/2 to 2 inches.

**DECEMBER:** A cold front swept the length of the peninsula on the first day. A deep low pressure system moving up the east coast kept cloudy skies over the state on the 2nd and 3rd, but temperatures plummeted into the 30's on both those mornings. The morning of the 4th and 5th saw temperatures in the 20's and low 30's with a general frost. Another cold front passed through on the 8th. The morning of the 10th temperatures were in the 20's and 30's with a light frost. A strong cold front moved through the state on the 17th, bringing rain to the peninsula. Temperatures dropped into the upper 20's and low 30's on the 18th and 19th. Rainfall was near 2 inches with some totals in excess of 3 inches being reported around the Tampa Bay area.

**JANUARY:** Temperatures remained well above normal the first two weeks of the month. This was ended by a cold front the morning of the 13th. Temperatures dropped from the 60's into the upper 40's and by the morning of the 15th into the 20's and low 30's with a light to moderate frost. A brief cool spell was experienced near the 21st. Total precipitation for the month ranged from 1 to 2 inches.

**FEBRUARY:** Temperatures remained well above normal until a cold front passed through early on the 7th. Skies cleared by the 8th, with minima in the 30's. Warm weather returned with temperatures remaining well above normal. February's precipitation ranged from 1 to 2 inches.

**MARCH:** A cold front passed through the state on the 2nd. By the morning of the 3rd, minima were in the 30's. On the 4th temperatures dropped a few degrees below those recorded on the 3rd. The remainder of the month was characterized by above normal temperatures with a series of weak fronts dropping temperatures to near normal every 5 to 7 days. Rainfall was again in the 1 to 2 inch range.

**APRIL:** The mornings of the 4th through the 7th saw temperatures drop into the low to mid 30's with frost in the colder locations.

## SOUTH FLORIDA

The 1974-75 season was warm and dry. Unseasonable warmth prevailed throughout the growing season. While many Arctic air masses reached North Florida only a few penetrated the southern portion of the peninsula, and these were modified considerably by the time they reached this area. Only isolated areas of South Florida had frost and/or freezing temperatures and these occurred in December and January. There were 14 "cold nights" in the Everglades and Kissimmee Valley District, 10 in the Indian River District, and 3 in the Lower East Coast District. Seasonal rainfall (November through March) averaged 4 to 7 inches below normal except for isolated areas along the east coast where rainfall amounts were only 2 inches below normal.

**OCTOBER:** During the first week heavy rains along with strong and gusty winds caused damage to crops along some of the coastal sections of Palm Beach and Broward.

**NOVEMBER:** Precipitation averaged about 1 and 1/4 inches above normal over all of South Florida. Temperatures averaged near normal with only minor day to day variations except for the two cool outbreaks of Arctic air which barely penetrated the southern portion of the peninsula. There were only two cold nights, the 22nd and 23rd, when temperatures reached 36 degrees or lower at isolated locations.

**DECEMBER:** There were three invasions of cold air. Frost and/or freezing temperatures occurred on the 4th, 5th, and 10th, and affected only a few interior station locations. Overall, the mean temperature averaged about 1 degree or less below normal, which was nearly the same as November. Rainfall averaged from 1/10 to 1/2 inches below normal in most areas.

**JANUARY:** The unseasonably warm weather was interrupted by only one cold spell which was short-lived, lasting only two days, the 14th and 15th. Minimum temperatures reached 32 degrees or below at only two or three isolated locations. The average mean temperatures for the month ranged from 4 to 7 degrees above normal. Rainfall was inadequate in most areas, with less than 1/4 inch recorded during the entire month at many locations.

**FEBRUARY:** The average temperature was 6 degrees or more above normal for the month, while rainfall was much below normal. Most precipitation occurred as scattered showers during the second and last week of the month and averaged 1/3 to 1/2 inch, except for a few isolated areas along the immediate east coast which ranged from 1-1/2 to 2-1/2 inches.

**MARCH:** One moderately strong cold front brought temperatures to the danger level on the 3rd and 4th. Isolated patches of frost occurred in a few cold pockets on the 4th. Mean temperatures for the month averaged 2 to 4 degrees above normal. Showers during the first and third weeks averaged less than normal for the month.

**APRIL:** A cold wave during the first week of the month dropped temperatures to the high 30's and low 40's in the interior locations, and the mid 40's to the mid 50's along the coastal section.

## 1974-75 PRODUCTION SUMMARY

Florida's 1974-75 season began in late January with pin head blooms forming in some areas. Cool, dry weather delayed full bloom until late February and early March. Open bloom occurred in all areas throughout March. March and April were very dry in most areas and many trees entered stress before the drought was broken in mid-May. The overall bloom was heavy and a good spring fruit set was experienced in all areas. Summer rainfall was adequate and trees and new crop fruit advanced normally.

The initial forecast of production was for a record 174 million boxes of round oranges. FCOJ yield projection was 1.29 gallons per box. The grapefruit forecast was for 45 million boxes, slightly less than the previous year's production.

Harvest of grapefruit began in late August in southern portions of the citrus belt and increased steadily throughout the fall. Internal maturity was substantially above average by October 1 and record quantities of both oranges and grapefruit moved to fresh markets. Color break was evident by mid-October and demand was good for all fresh citrus.

November and December dry weather softened fruit to some extent. Several nights of freezing temperatures occurred in most areas but no damage other than minor leaf burn was reported.

As in the 1973-74 season, January weather was unseasonably warm. Temperatures reached the mid-80's in Central Florida locations and left trees vulnerable to later cold weather. However, none materialized. February and March were relatively dry. Irrigation was heavy in most areas.

April and May were extremely dry as in the previous spring. Trees in many lower interior and west coast areas entered stress conditions. Limited tree mortality occurred in some areas before seasonal rains began.

Harvest patterns were considered near normal. Labor was readily available due to higher industrial unemployment.

Total pickout was a record high 173.3 million boxes of round oranges. Grapefruit pickout was 44.6 million boxes, about 7 percent less than the record 48.1 million boxes produced in 1973-74. Pack of FCOJ totaled 178.2 million gallons from 135.5 million boxes. Final FCOJ yield was 1.31482 gallons per box.

California's citrus crop was in good condition throughout most of the growing season. Freezing temperatures in December and January brought varying amounts of damage, mostly in quality. Temperatures dropped into the mid-20's in late January but no significant tree damage was reported.

The initial forecast was for 24 million boxes of early and mid-season varieties and 26 million boxes of Valencias, a sizable increase from the previous year's production. Total pickout was 28 million boxes of early and mid and 27 million boxes of Valencias. The total orange production of 55 million boxes was 36 percent greater than the previous season. Grapefruit production was 6.4 million boxes, 38 percent greater than the previous year's production, but only slightly more than the 1972-73 production.

Arizona's crop remained in good condition throughout most of the season despite cold weather in December and January. Production was forecast at 4,250,000 boxes. Final pickout was 4,970,000 boxes, slightly less than the

record 1968-69 season. Grapefruit production was 2,770,000 boxes, up slightly from 1973-74 production.

Texas began shipping fresh citrus in September. The initial forecast was for 7.8 million boxes of grapefruit. Early and midseason varieties were forecast at 3.8 million boxes and Valencias at 2.3 million boxes.

The citrus producing area was hit by a moderately hard freeze in mid-December. Tree damage was not severe, but some loss of fruit occurred.

Total pickout of early and mid-season varieties was 2,930,000 boxes. Total production of Valencias was 1,610,000 boxes, lowest in several years. Grapefruit production was 7.3 million boxes, also the lowest level in several years.

### AERIAL PHOTOGRAPHY

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography in December, 1965. Ground crews in 4-wheel drive vehicles identified all the State's groves by year in which set, fruit type and row spacing. Photo-interpretors in the Orlando office then delineated the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks were measured with planimeters to obtain acreage and indexed by land section.

The 1965 survey indicated that there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory survey was designed for quick and economical updating. Since that time, the production area has been re-surveyed each second winter - 1967, 1969, 1971 and 1973 - to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 60 to 90 days. The same three-mile wide flight lines established in 1965 are photographed on each succeeding flight. Approximately 13,000 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey shows there were 864,098 acres of commercial citrus, as of the end of 1973. This is a net decline of 1.6 percent from the 878,019 acres in 1971. The new survey shows a removal of 40,200 acres between the surveys, more than offsetting the 26,260 acres of new trees, set in 1972 and 1973.

Significant net acreage gains were registered in only a few counties, the principal ones being DeSoto and Hendry. Most citrus types reflect a slight reduction. However, in seedless grapefruit varieties, there was a gain in acreage, primarily along the Lower East Coast.

There are approximately 1,200 enlargements on file. These enlargements are replaced over a four-year period, approximately 600 after each flight year and information from the old enlargements is transferred by hand to the new enlargements.

Between surveys, research is directed toward better methods of enumerating and reporting changes that are occurring within commercial groves. Particular emphasis is placed on the method of counting vacancies and resets below the 10 percent vacancy rule currently in effect. On November 1, 1975 photographing began for the next biennial survey. Preliminary data on acreage set in 1974 and 1975 should be available by August 1976.

1974-75 VALUE OF SALES AND ON-TREE PRICES

VALUE

The on-tree value of all Florida citrus increased slightly over last season. The \$381,904,000 preliminary value is 6 percent greater than last season's but 11 percent below the record \$427,245,000 value in 1971-72. Higher returns were realized for all types of citrus except Temples, Tangelos, K-Early citrus fruit and lemons.

The preliminary on-tree price per box for all oranges at \$1.52 compares with last season's revised price of \$1.47. Slightly less than 8 percent of the total orange crop moved through fresh channels this season compared to less than 7 percent last season. Fresh price received was 11 percent greater, averaging \$2.33 per box compared to \$2.10 per box for the previous season.

The delivered-in price for spot and cash fruit going into concentrate was \$.41 per pound of solids. Early and mid-seasons averaged \$.40 and Valencias averaged \$.43 per pound of solids. The 1973-74 season's average for priced oranges was \$.43 per pound of solids.

Preliminary on-tree price for grapefruit averaged \$1.86 per box this season compared to \$1.66 last season. A record 42 percent of the crop moved through fresh channels. On-tree price per box for fresh fruit was higher at \$3.33 compared to \$2.54 last season. Value of the total crop was up slightly on 7 percent less boxes. For the sixth consecutive season, price per box for grapefruit was greater than for oranges.

Fresh fruit sales and price per box of tangerines, honey tangerines and Tangelos increased from last year. Prices for processing of all speciality fruits declined to their lowest levels in recent years. For total crop sales, only tangerines and honey tangerines showed an increase in price per box. All other speciality fruit declined in price per box.

Florida, all citrus: Value of sales, on-tree, crop years 1965-66 through 1974-75

Crop year	Value	Crop year	Value
1965-66	\$225,408,000	1970-71	\$315,882,000
1966-67	178,075,000	1971-72	427,245,000
1967-68	308,876,000	1972-73	394,645,000
1968-69	286,769,000	1973-74 <sup>1/</sup>	359,388,000
1969-70	244,676,000	1974-75 <sup>2/</sup>	381,904,000

<sup>1/</sup> Revised. <sup>2/</sup> Preliminary.

COUNTY PRODUCTION

Estimates of production by fruit type and county published by the Crop Reporting Service are based on objective survey data. Fruit numbers per tree from the limb count survey conducted in late July, August and early September, adjusted for droppage, projected to harvest and projected size at harvest are expanded by tree numbers.

These estimates are calculated at the request of the citrus industry for planning purposes. They are based on production area sample data and estimates, and may vary greatly.

PRICES

All on-tree prices reported by the U. S. Department of Agriculture's Statistical Reporting Service and the Florida Crop and Livestock Reporting Service represent

the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season beginning with the first month that three percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service calculates an average mid-month price. Fresh fruit sales organizations provide the average F.O.B. price and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value of fruit previously classed as non-priced fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final process price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by producers.

FOREIGN EXPORTS

Exports of fresh Florida oranges to countries other than Canada and Mexico were up substantially in 1974-75 from that of the previous season while grapefruit was down slightly. A small quantity of tangerines was shipped abroad. Reduced orange production in countries bordering the Mediterranean and high prices of competitive fruits in Europe contributed to an increased movement to the continent.

There were 4,443,000 boxes of citrus exported this past season. Grapefruit continued to be the most important type of citrus going to this market outlet and accounted for 77 percent of the total volume. Japan was the principal destination followed by Germany and France. Minor shipments were recorded going to seven other European countries and Puerto Rico.

Germany was the leading country to receive fresh oranges followed by Holland, Puerto Rico and Iran. Small shipments went to five other European countries, Japan and Hong Kong. Tangerines were shipped primarily to Puerto Rico.

Citrus box weights: Approximate net weight in pounds by fruit type and states

States	Oranges and others <sup>1/</sup>	Grapefruit	Tangerines	Lemons	Limes

#### History of Florida's citrus industry

The citrus trees is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were growing in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the state. One of the oldest cultivated groves planted in Florida (Hume, 1926 p. 95) is thought to be the Don Phillipe grove in Pinellas County, planted some time between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began Florida's dominance of the Nation's citrus became even more apparent. In 1974-75 Florida had 71.3 percent of the Nation's production.
