Agricultural Marketing Service and
Statistical Reporting Service

Acknowledgment

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Bureau of Market News and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Cannery Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Growers Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of Paul E. Shuler and Robert R. Terry of the Florida Crop and Livestock Reporting Service, and E. F. Scarborough, Bureau of Market News.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1975-76 CROP YEAR

CENTRAL FLORIDA

The 1975-76 winter season was rather unique in that there was practically an unbroken stretch of cold weather that began abruptly in the middle of November and ended similarly in the middle of February. Citrus entered a state of rest early in the winter and remained such throughout the winter. There were 53 cold nights during the season. January was the coldest month with 19 cold nights. There were only a few nights when temperatures were low enough and durations long enough to do damage to fruit or foliage, and these conditions only occurred in the traditionally colder frost pockets that were unprotected. Rainfall was below normal each month with an average rainfall for November through March of approximately 6 inches.

NOVEMBER: The season opened warm and dry. The change from summer-like weather to winter was very abrupt on November 13. The coldest of this four-day period was the 15th when minimum temperatures were mostly in the low to high 30's, with a few high 20's in the coldest locations, and there was considerable frost. A second cold spell was November 24 through 26. Precipitation totals generally ranged from 0.5 inch to 1.5 inches.

DECEMBER: This was a cold, dry month. The average number of cold nights in Central Florida was 8, ranging from a low of 6 in the Bartow District to 11 in the Orlando District. There were four cold periods, December 3-4, 10 through 12, 19 through 24 and 27 through 29. Of these, the mornings of December 22 and 23 were the coldest. Minima generally ranged from the high 20's to the low 30's on these occasions. In isolated locations minimums approached the low 20's. Durations were brief below freezing temperatures. Frost occurred on December 11, 19, 20, 22, 23, 24 and 28 over much of the farming area. Rainfall totals averaged less than 1.0 inch with many stations reporting less than 0.5 inch.

JANUARY: The cold, dry weather of December continued through January but with more intensity. The frequent cold periods were mostly of two to three days duration. Freezing temperatures occurred over much of Central Florida on at least 10 nights. The 19th, 23rd and 29th were generally the coldest when minima ranged from the low and middle 20's to the low 30's over a great portion of the Central Peninsula. Rainfall totals averaged a little less than 1.5 inches in the north-central portion and slightly more than 0.5 inch in the south-central portion.

FEBRUARY: Winter ended in mid-February as abruptly as it began in mid-November. During the first two weeks temperatures averaged well below normal and freezing temperatures and frost occurred frequently with only a brief, mild period from the 5th through the 7th. Coldest mornings were the 3rd and 10th, but none of the cold periods were as cold as those of December and January. Rainfall totals were mostly less than 1.0 inch throughout Central Florida, averaging near .67 inch.

MARCH: The mild weather of late February continued through March with the exception of a brief cool spell on the 17th and 18th. Average daily temperatures were normal or above throughout most of the month. One to 2 inches fell at many locations and some had in excess of 3 inches. Irrigation of citrus was quite widespread and this was the period of full bloom.

SOUTH FLORIDA

The 1975-76 winter season was not unusually cold but wide monthly temperature variations, coupled with a shortage of precipitation and an early frost in mid-November, caused almost continuously hazardous growing conditions for tender truck crops and sugar cane. For the most part the cold weather enhanced color and quality of citrus while causing only minor damage to new growth in the coldest areas. Irrigation was necessary for several months. After the middle of February ideal weather conditions prevailed. Rainfall for November through April averaged well below normal.

NOVEMBER was mild until the first cold outbreak of Arctic air swept across South Florida on the 13th. There was a total of 4 cold nights during the month. The lowest temperatures ranged from 30 to 33 F in all districts. The early frost and/or freezing temperatures on the 15th, 24th and 25th extended south to the Immokalee and Homestead farming areas. Strong, gusty and dry winds occurred on the 12th and 14th. Rainfall averaged around .50 inch in the interior and west coastal sections, and around 1.50 inches along the east coastal sections.

DECEMBER temperatures and rainfall averaged below normal. Mild to warm conditions continued until a moderately cold air mass moved across the South Florida area during the evening of the 9th and morning of the 10th. On the 11th, minima dropped to 32 F or below at the coldest locations. The lowest temperatures occurred on the 22nd and 23rd. These ranged from 27 to 32 F in the coldest locations, to the upper 30's and low 40's elsewhere. There were 6 cold nights and 4 nights with freezing temperatures or lower. Rainfall amounts ranged from none in some areas to over 2 inches in the Pompano area.

JANUARY was unusually cold and dry. This was the coldest January since 1970-71. The 11 cold nights were the 2nd, 9th, 10th, 18th, 19th, 22nd, 23rd, 24th, 29th, 30th and 31st. Generally, temperatures ranged from 30 - 35 F at interior locations during the cold spells and 35 - 45 F elsewhere. The coldest temperatures of the season, 21 F occurred on the 18th in the Kissimmee Valley District. The lowest temperature for the season in the other districts are as follows: Everglades and Indian River Districts 26 F on the 18th and the Lower East Coast District, 31 F on the 18th and 23rd. The east coast had 1 to 2 inches of rainfall and other areas had from less than .50 inch to none.

FEBRUARY was cold through the 12th. A cold front moved through on the 2nd. The cold days of early February - 3rd, 4th, 7th, 9th, 10th and 11th minimum temperatures generally ranged from 28 to 35 F in colder locations and 33 to 45 F in most farming areas. Almost ideal weather conditions prevailed during the last half of the month. Rainfall around Lake Okeechobee averaged around 2 inches. Along the east coast, rainfall varied from nearly 3 inches to nearly 6 inches.

MARCH was both warm and dry. Temperatures averaged 3 to 5 degrees above normal. Maximum temperatures ranged mainly from the mid 70's to the mid 80's, while minima ranged mainly in the 50's and 60's in the interior farming areas and mainly in the 60's along the coastal farming areas. Rainfall averaged around 1 inch.

Florida's 1975-76 season began, as in the previous season, in late January with bloom first appearing in southern areas of the state. By mid-February, open bloom was present in most areas. Average temperatures were above normal statewide and rainfall was adequate. Cooler weather in March and April prolonged the bloom period, but a good set was experienced on all types. May rainfall was below normal levels, particularly in southern growing areas.

The first forecast of the season was for 172 million boxes of oranges, slightly less than was harvested the previous season. The grapefruit forecast was for 50 million boxes, a record.

Harvest began in late August with limited amounts of grapefruit being shipped. Internal maturity was above average by September 1 and shipments of both oranges and grapefruit increased steadily throughout the fall.

Fall and winter rainfall and temperature levels remained near normal with moderate frost occurring on only a few mornings. February and March temperatures were generally above normal levels, with rainfall generally adequate.

May rainfall levels were above normal in most areas and by July 1 total rainfall for the year was above normal.

Harvest patterns during the season were normal and a record 181.2 million boxes of oranges were harvested. Excellent growing conditions in the spring reduced droppage on Valencias and more were harvested than anticipated. A record 49.1 million boxes of grapefruit were also utilized.

Pack of FCOJ totaled 186.3 million gallons from 144.5 million boxes. Final yield was 1.28879 gallons per box.

California's citrus season began with shipments of new crop fruit beginning in mid-October. Navels were about two weeks later than normal. Grapefruit shipments began in early November. Freezing temperatures hit in late December and early January on several mornings with lows reaching the 23 and 25 degree range. Some tree damage in unprotected groves and diversion of some damaged fruit to by-products was reported.

The initial forecast for all oranges was 48 million boxes, slightly less than the previous season's production. Total production reached 52.3 million boxes, only 5 percent less than the previous season's record harvest.

Grapefruit were forecast at 5.7 million boxes but picked out at 7.2 million boxes, a record harvest.

Arizona's crop was somewhat later in maturing than normal due to a cool spring, but by December, grapefruit and Navels of good quality were being shipped. Below freezing temperatures in late December did limited damage in unprotected groves and limited fruit loss was experienced. Another freeze in early March also caused limited damage, but mostly to young trees.

The orange crop was initially forecast at 4 million boxes, but only 2.680 million boxes were harvested, the lowest amount in recent years. Grapefruit production was forecast at 2.9 million boxes. There were 3.080 million boxes harvested, the largest crop in 5 years.

Texas citrus shipments began in mid-September. Excellent quality oranges and grapefruit were shipped all season in spite of freezing temperatures on several mornings. No significant damage however, was reported.

The initial forecast for oranges was 5.8 million boxes. Production was 6.2 million boxes. Grapefruit were forecast at 10.0 million boxes and picked out 10.7 million boxes.

Tree Census

The Florida Crop and Livestock Reporting Service first began indexing the state's commercial citrus groves on aerial photography in December 1965. Ground crews in 4-wheel drive vehicles identified all the state's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineated the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks were measured with planimeters to obtain acreage and indexed by land section.

The 1965 survey indicated that there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter - 1967, 1969, 1971, 1973 and 1975 to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile wide flight lines established in 1965 are photographed on each succeeding flight. Approximately 13,500 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey shows there are 852,369 acres of commercial citrus as of January 1976. This is a net decline of 1.4 percent from the 864,098 acres in December 1973. The new survey shows a removal of 40,518 acres between surveys, more than offsetting the 28,789 acres of new trees set in 1974 and 1975.

Acreage gains were recorded in only a few counties, the principal ones being Hendry, Indian River and St. Lucie. All types of citrus showed net declines except seedless grapefruit.

In addition to simply enumerating the changes in acreage, the last two surveys (1973 and 1975) also included the reason for the change. This Alteration Summary is designed to determine what types of plantings are being made and why the acreage is being removed from commercial production.

The results of this survey showed that one-half of the acreage that was planted in the calendar years 1974 and 1975 was reset planting. Also, 25% of the new acreage was planted on land that had never before been used for citrus. Of the acreage that was removed from commercial production, approximately 12.5% was taken out for commercial development. The comparable figures for the years 1972 and 1973 showed that one-third of the new acreage was reset plantings, and slightly more than 25% of the removals was for commercial reasons. The current survey also showed that most of the new acreage was located in the East Coast and Lower Interior areas of the state. Two-thirds of the loss due to commercial development occurred in the Lower Interior and West Coast. The East Coast was the only area of the state showing a net gain.

There are approximately 1,200 photography enlargements on file. These are replaced over a four-year period, approximately 600 after each flight year. Information from the old enlargements is transferred by hand to the new enlargements. Work on the seventh biennial tree census will begin in November 1977.

VALUE

The preliminary on-tree value of all Florida citrus increased a dramatic 24 percent from the previous season. The record \$493,610,000 is almost 16 percent above the previous high 1971-72 season. All fruit types recorded greater returns except grapefruit and K-Early Citrus Fruit.

The preliminary on-tree value of all oranges is 35 percent higher than last season, on a 5 percent larger crop. The grapefruit value, however, is 11 percent less on a 10 percent larger crop. An all-time high, 93.5 percent of all oranges, moved into processed products. Preliminary price per box of oranges is \$2.10, thirty percent higher than last season's \$1.62 and the highest in more than 10 years.

The delivered-in-price for spot and cash fruit going into FCOJ was \$.53 per pound of solids compared to last season's \$.43. Early and Midseason varieties were \$.51 per pound and Valencias were \$.56.

Grapefruit prices received were the lowest in seven years. The \$1.38 per box is 20 percent less than last season's \$1.72. For the first time in 6 seasons, price per box for oranges was more than for grapefruit.

Prices per box of all specialty fruit except Tangelos and K-Early Citrus Fruit were above last season.

Florida, all citrus: Value of sales, on-tree, crop years
1966-67 through 1975-76

Crop year	Value	Crop year	Value
1966-67	\$178,075,000	1971-72	\$427,245,000
1967-68	308,876,000	1972-73	394,645,000
1968-69	286,769,000	1973-74	359,388,000
1969-70	244,676,000	1974-75 ^{1/}	397,066,000
1970-71	315,882,000	1975-76 ^{2/}	493,610,000

^{1/} Revised. ^{2/} Preliminary.

COUNTY PRODUCTION

Estimates of production by fruit type and county published by the Crop Reporting Service are based on objective survey data. Fruit numbers per tree from the limb count survey conducted in late July, August and early September, adjusted for droppage, projected to harvest and projected size at harvest are expanded by tree numbers.

These estimates are calculated at the request of the citrus industry for planning purposes. They are based on production area sample data and estimates, and may vary greatly.

PRICES

All on-tree prices reported by the U. S. Department of Agriculture's Statistical Reporting Service and the Florida Crop and Livestock Reporting Service represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season beginning with the first month that three percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service estimates an average monthly price. Fresh fruit sales organizations provide the average F. O. B. price and processors supply an average

spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value of fruit previously classed as non-priced fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final process price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by producers.

FOREIGN EXPORTS

Grapefruit exports from Florida in 1975-76 were the leading fresh citrus commodity shipped abroad. This past season a record 4,100,000 boxes of fresh grapefruit were marketed to countries other than Canada and Mexico. A continuous export growth has been experienced for this crop in the past five crop years except in 1974-75 when there was a slight drop in the volume moved. Florida tops other states in the exports of fresh grapefruit accounting for 56 percent of this market. Japan was the most important receiver of the fruit followed by France, Germany and Holland. France reflected the largest percentage gain in volume in 1975-76 to that of the previous season when the movement jumped from 438,000 boxes to 728,000 boxes.

Germany was the principal outlet for Florida fresh orange exports in 1975-76. This country received over 60 percent of the 790,000 boxes shipped abroad. Specialty citrus fruits such as tangerines were exported to a limited extent with a season total of 105,000 boxes.

Orange concentrate exports remain at a high level according to the U. S. Bureau of Census records for the past three fiscal years (July to June). The data is not available by U. S. states of origin; however, it can be assumed that it was primarily from the major processing state, Florida. In 1973-74 there were 11,600,000 gallons exported with Canada receiving 50 percent and the other countries 50 percent. The total recorded for 1974-75 reflects 12,600,000 gallons of which 52 percent went to Canada and 48 percent to other countries. For the first eleven months of 1975-76 there were 11,800,000 gallons exported with Canada accounting for 57 percent and the other countries 43 percent.

Citrus box weights: Approximate net weight in pounds
by fruit type and states

States	Oranges and others ^{1/}	Grapefruit	Tangerines	Lemons	Limes

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were growing in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the state. One of the oldest cultivated groves planted in Florida (Hume, 1926 p. 95) is thought to be the Don Phillipe grove in Pinellas County, planted some time between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began Florida's dominance of the Nation's citrus became even more apparent. In 1975-76 Florida had 74.0 percent of the Nation's production.

Footnote 1/ for pages 34 and 36. Final Mexico import shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 34 and 36 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases gave separate totals for these two types of citrus.
