ANNUAL CROP SUMMARY 1929

DEPARTMENT OF AGRICULTURAL STATISTICS
WEST LAFAYETTE, INDIANA

No. 51

DECEMBER, 1929

CROP SUMMARY FOR INDIANA, 1929

The acreage of winter wheat seeded in the fall of 1928 for the 1929 harvest was sharply reduced from the previous year. The heavy loss of acreage in 1928, lower prices than expected in the fall, and local drouth making seed bed preparation difficult, were all factors contributing to the decrease in acreage. The crop entered the winter in little better than average condition and winter losses were rather light amounting to only 4 per cent of the acreage. There was considerable damage from Hessian fly in the southern third of the state. The wet cold weather in May and June of 1929 also seemed especially unfavorable in that section and yields there were much below average. Elsewhere yields were good and the state yield was above average.

Rye sowings were slightly reduced in the fall of 1928, but winter losses were nominal, so more was harvested in 1929 than in the previous year. Yields were below average.

The acreage of corn was reduced by a return to more normal rotation practice which was disturbed by the heavy losses of winter wheat in 1928. The excessive rainfall of May and June caused a further reduction beyond the intention of farmers. This wet weather prevented proper early cultivation of corn so it was rather weedy. The cool summer months prevented a recovery from the late start and yields were below average. Summer drouth was severe in the southern counties. Frost came rather early and the fall months were cool, so corn cured poorly and quality was low. The wet weather of November and December delayed completion of husking causing unusual damage to ears which broke over and were in contact with the ground.

Oats were reduced in acreage for the same reasons as corn: Late oats were thin and made poor yields. Early oats did well, but were a small part of the total so state yields were much below average.

A very large acreage of clover was seeded in the spring of 1928 and stands were good. There was little winter killing so hay acreage increased sharply. The spring was favorable for hay and yields were high. Spring seedings of clover in 1929 were large and made extraordinary growth.

A very large acreage of clover seed was cut and made somewhat better than average yield.

Timothy hay being largely in the southern districts was adversely affected by the cold spring and by the drouth which began in June.

Soybeans increased in acreage mainly by expansion into areas where they had not been much grown. Yields were good both for beans and hay. Cowpeas seem to be giving way to soybeans and again suffered from the summer drouth in the southwest district where they are mainly grown.

Peaches made a large crop. Apples and pears were rather short having been frosted at blooming over the norther two-thirds of the state.

Tobacco acreage was increased sharply as a result of better prices but the yield per acre was reduced by drouth.

Tomatoes made a fair crop, but cucumbers, cabbage, canteloupe, peas, and sweet corn were below average. Watermelons yielded well.

Onions made very heavy yields in the northeastern district, but less than average in the north central and northwest districts.

Pastures were above average till fall, but fell below average in September and October. With the larger acreage of clover, principally medium red, the percentage of clovers used for pasture dropped slightly. Of the total acreage of red clover 30 per cent was used for pasture only, while 63 per cent of the alsike and 30 per cent of the mammoth were pastured. Of sweet clover 85 per cent was pastured. Soybeans pastured were 18 per cent of the acreage and cowpeas 17 per cent. Of mixed clover and timothy 64 per cent was pastured only. Approximately 1,640,000 acres of red and alsike clover were seeded in the spring of 1929. Of this about 90 per cent was considered a satisfactory stand in October. Of the sweet clover seeded in 1929, 78 per cent was standing in the fall.

3

Winter Wheat was sown on 1,746,000 acres in the fall of 1929 compared with 1,695,000 in 1928. Unsatisfactory prices kept down the acreage. On December 1st the condition was 89 compared with a ten year average of 85.

The acreage of rye sown for grain in the fall of 1929 was 143,000 compared with 130,000 in 1928. The December 1st condition was 90 compared with the ten year average of 91.

Tomatoes:						
1928.....	399,730	3.49	1,394,000	Ton	29.60	41,261,000
1929.....	434,370	4.25	1,846,100	Ton	27.51	50,777,000
Watermelons:						
1928.....	206,930	306	63,295,000	Number	1174.00	11,025,000
1929.....	203,560	332	67,616,000	Number	1175.00	11,820,000
Total with duplications eliminated:						
1928.....	362,675,630					128,502,200,000
1929.....	367,083,120					128,586,619,000

¹ See individual crop tables for detailed notes.² Pounds or per pound.³ Includes total crop gathered, hogged off, and otherwise utilized except where harvested for hay only.⁴ Price other than Dec. 1. Refer to crop by States.⁵ Seasonal average price.⁶ Trees tapped.⁷ Per tree.⁸ Production is the total for fresh fruit, juice, and raisins, including grapes not harvested in 1928.⁹ For commercial truck crops the price is the average price for the season paid to growers.¹⁰ Included in "Potatoes."¹¹ Per 1,000 melons.¹² Values based on prices shown for each crop.

The data in the following tables were published originally in Purdue University Agricultural Experiment Station Bulletin No. 320, "Prices of Farm Products in Indiana." According to the plan presented in this bulletin the data will be brought up to date and published annually in "Indiana Crops and Livestock." A copy of the original publication may be obtained from the Experiment Station.

TABLE IX. INDIANA INDEX NUMBER OF FARM PRICES

Based on Indiana farm prices for 17 products on the fifteenth of each month (1910 to 1914=100)

YEAR	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Yearly Average
1910.....	107	107	112	110	106	104	102	99	104	100	95	93	103
1911.....	93	89	86	83	81	82	86	92	95	91	90	91	83
1912.....	94	96	97	104	106	104	100	100	102	102	96	95	100

FEBRUARY, 1929

LIVE STOCK SUMMARY, INDIANA, JANUARY 1, 1929

The inventorial estimates of livestock on farms January 1, 1929, show decreases in the numbers of horses and swine, no change in mules, and moderate increases in other classes of livestock.

There seems to be little slackening in the decline in numbers of horses kept on Indiana farms. The farms reporting do not show as much loss as the reported birth rate would indicate. There is little evidence that the numbers of farms without horses has increased materially so the way in which numbers are so nearly maintained continues an enigma, as the records do not show notable inshipments.

Mules are being foaled at a very low rate, but apparently a somewhat higher rate than horses. The maintenance of numbers reported is not easily explained, but a sample of over 8,000 farms indicates no decrease.

Again a 2 per cent increase in milk cows was shown by the reports. This is in line with the increase in the number of heifers being kept for milk cows last year. The number of heifers increased again this year, so apparently dairy expansion is still in progress. Milk cow values rose \$10 per head the past year.

The conditions for increase seems less favorable this year than last from some standpoints. Grain is cheaper in most instances but with the larger numbers of livestock and a smaller hay crop the same rate of feeding as last year will practically exhaust hay supplies by the time pasture is available. It is also noteworthy that the smaller clover acreage reduced the proportion of legume hay as it was not fully balanced by the increase of soybeans.

The numbers of all cattle made a 1 per cent gain. This is all in the classes mentioned above, as beef cattle on feed were only 90 per cent of the previous year January 1st. The corn crop was larger but with hay less plentiful many prospective feeders did not care to pay the high prices prevailing for feeder cattle.

The values of all cattle were higher than last year. This change together with the increase in numbers made the valuation of all cattle \$11,244,000 above last year.

Sheep number 21,000 more than last year. Feeding sheep numbered only 90,000 head compared with 103,000 head last year so the gain in breeding sheep was 34,000. The values per head were only slightly higher than a year ago.

The decrease in the numbers of hogs followed the regular hog cycle. The weighted average monthly price for hogs in 1928 was \$9.08 per hundred pounds compared with \$9.85 in 1927. As corn averaged higher the price of hogs was less satisfactory. Monthly shipments figures show that there was an accumulation of hogs a year ago when the feeding value of corn was low for marketing in the early months of the year. They indicate also that marketing was more rapid than usual the last months of 1928, so that the yearly change in numbers was greater than in normal seasons even in a period of liquidation.

The supplies of hay and feeding grains in Indiana for the seasons following the crops of 1927 and 1928 respectively, were: All hay 3,402,000 tons; 3,031,000 tons. Corn 145,063,000 bushels; 163,309,000 bushels. Oats 52,082,000 bushels; 94,902,000 bushels. Barley 946,000 bushels; 2,264,000 bushels.

THE PIG SURVEYS

June 1, 1928. The survey showed 91.1 per cent as many pigs saved as in the preceding spring from 91.7 per cent as many sows farrowed, with 6.0 pigs per litter the same as last year. The intended breeding of sows for this crop was 99.8. For the 1928 fall crop the survey showed 109.7 per cent as many sows bred as were farrowed in the fall of 1927. December 1, 1928. This survey showed only 92.9 per cent as many sows farrowed as in 1927 though breeding was 109.7 per cent. Pigs saved were 95.6 per cent of those saved the previous fall, with the average pigs per litter at 6.3 compared with 6.1 last year.
