DECEMBER, 1930

CROP SUMMARY FOR INDIANA, 1930

The drouth of 1930 was the most spectacular feature of the crop season of 1930. It is usually thought of as the cause of the acute financial difficulties or even distress of many farmers. However the loss from the drouth is less than the loss to farmers from the shrinkage in the prices of products, which took place about the same time. This shrinkage of prices resulted in reduced incomes even where crop yields were good. Much space must be given the drouth in the discussion of factors affecting production, but in a discussion of financial returns from the 1930 crop the "business depression" should be described as distinctly more damaging than the drouth, over most of the state.

The acreage of winter wheat sown in the fall of 1929 for harvest in 1930 was only 3 per cent larger than the unusually small acreage sown in the previous fall.

The fall rainfall was ample and temperatures favorable so the crop entered the winter in better than average condition.

Winter temperatures were low but snow cover was usually ample till March. Then there occurred several nights of freezing with drying winds. Reporters comments indicate this was the period mainly responsible for the loss of 12 per cent of the acreage by winterkilling. The counties at the headwaters of the Wabash River suffered most severely though damage was reported from nearly all the counties along this stream.

Beginning in March the precipitation was below normal all summer and temperatures were above normal. This created much apprehension for wheat yields especially in the southern part of the state where deficiency of rain was greatest. There were no protracted periods of extreme temperatures before wheat harvest, however, and as very little leaf rust developed yields were nearly average in the south, and above average for the state.

Rye had practically the same story as wheat.

The comparatively dry spring put farm work well forward and the acreage of oats sown was increased over the previous year. Dry weather prevented a heavy growth of straw, and until threshing time the oats crop was thought to be very poor. Threshing showed that the quality of the grain was better than average and that the part of the acreage threshed made a yield equal to the ten year average. The acreage of oats not threshed but harvested as hay or other roughage was larger than usual and this acreage had smaller yields of grain than the portion harvested in the usual manner. This cut the state average yield about two bushels. The southern third of the state had rather low yields.

The acreage planted to corn increased slightly. Dry weather caused poor stands and uneven growth in many fields but permitted frequent cultivation and destruction of weeds, so that on July 1st prospects were about average with only the southern districts showing any positive damage. The drouth which began in the spring continued till September and the final yield for the state was among the lowest recorded. Along the Ohio River yields were the lowest in a generation and as far north as Indianapolis they were generally below average. The counties along the Wabash River above Lafayette had yields equalling or exceeding the ten year average, but along the Michigan boundary lower yields again appeared.

The quality of the grain was better than average in the districts getting good yields, but in the less favored sections worm damage and drouth effects lowered quality materially. A dry fall permitted an early harvest and enhanced quality.

Barley grown in large part north of the districts where drouth became intense early in the season made an average yield. Threshing returns were above earlier expectations.

The spring drouth reduced yields of all grass and meadow hay crops. Timothy probably was most damaged because a larger portion of the acreage is in the southern districts. Pastures were poor throughout the summer. The condition each month from July to October was as low or lower than in any corresponding month in 15 years.

The acreage seeded to clover in the spring was the largest in years, being 1,950,000. In October only 45 per cent was still standing, the rest having perished in the drouth. The percentage surviving by kinds was medium red 44, mammoth 44, alsike 54, and sweet clover 61

The acreage of soybeans planted was the largest in history. Hay yields were lowered by drouth but grain yields held up to near average. Cowpeas were decreased in acreage again and both grain and hay yields were reduced by drouth.

Buckwheat acreage was only two-thirds of last year. There was no need for a catch crop in the northern part of the state and drouth made sowing useless in many southern counties. Yields were somewhat below average.

Tobacco setting was hindered by drouth and growth retarded. Late growth occurred after September rains but yields were low and quality poor.

Potatoes made better than average yields as the acreage is mainly in the northern part of the state and the fall permitted late growth.

The clover seed crop was about average in both acreage and yield, though much below the large crop of 1929. There was some production of alfalfa seed, which is unusual, though the acreage was too small to estimate. Timothy seed was lower than usual in both acreage and yield.

Truck crop acreages were nearly all larger than last year. Those grown mainly in northern districts made good yields. Those in southern districts were poor. Onions made a heavy yield of exceptional quality. Strawberries, watermelons and cantaloupes were a short crop. Tomatoes, sweet corn, peas and cucumbers were larger crops than last year both in acreage and yields.

Fruit crops were all below average though apples and grapes were better than last year. Pears were much reduced by drouth. Peaches were a virtual failure, the low temperatures of the preceding winter having killed practically all buds and many trees.

The acreage of winter wheat sown for the 1931 harvest was 1,715,000 acres or 99 per cent of last year. December 1st condition at 88 was four points above average.

Rye acreage sown is estimated at 146,000 or 130 per cent of last year. Possibility of other utilization than for grain, because of feed shortage growing out of the drouth, makes this estimate less reliable than is commonly the case. Condition December 1st was 89 or one point below the 10 year average.

1927	31.5	15.5	25.0	13.6	1.47
1928	35.2	11.0	37.0	11.0	1.37
1929	32.0	17.0	28.5	13.0	1.63
1930	26.2	18.0	30.0	13.0	1.02
Average 1920-1929	35.8	15.0	30.0	13.0	1.32

TABLE VI.

Total Production of Principal Crops Harvested in Indiana for Past Twelve Years

Year	Corn (Bushels)	Winter Wheat (Bushels)	Oats (Bushels)	Rye (Bushels)	Tame Hay (Tons)
1919	180,634,000	41,400,000	56,000,000	4,432,000	2,562,000
1920	195,777,000	24,840,000	76,875,000	3,892,000	2,844,000
1921	169,848,000	24,144,000	45,888,000	3,978,000	2,572,000
1922	176,305,000	28,884,000	31,626,000	4,200,000	3,699,000
1923	192,616,000	34,188,000	48,692,000	4,186,000	2,597,000
1924	113,920,000	28,900,000	69,375,000	2,174,000	3,506,000
1925	203,232,000	25,636,000	59,864,000	1,653,000	1,982,000
1926	177,536,000	33,940,000	61,500,000	2,102,000	2,477,000
1927	132,458,000	27,621,000	48,700,000	1,618,000	2,980,000
1928	157,802,000	9,900,000	89,910,000	946,000	2,558,000
1929	131,968,000	27,659,000	54,008,000	1,625,000	3,517,000
1930	110,197,000	28,998,000	57,420,000	1,378,000	2,005,000
Average 1920-1929	165,146,000	26,571,000	58,644,000	2,637,000	2,873,000

The data in the following tables were published originally in Purdue University Agricultural Experiment Station Bulletin No. 320, "Prices of Farm Products in Indiana." According to the plan presented in this bulletin the data will be brought up to date and published annually in "Indiana Crops and Livestock." A copy of the original publication may be obtained from the Experiment Station.

TABLE VII. INDIANA INDEX NUMBER OF FARM PRICES

Based on Indiana farm prices for 17 products on the fifteenth of each month (1910 to 1914 = 100)

Year	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Yearly Average
1910	107	107	112	110	106	104	102	99	104	100	95	93	103
1911	93	89	86	83	81	82	86	92	95	91	90	91	88
1912	94	96	97	104	106	104	100	100	102	102	96	95	100
1913	95	98	102	107	100	102	104	105	107	106	105	103	103
1914	105	107	107	106	105	95	104	111	114	107	101	102	105
1915	105	104	103	105	108	105	102	100	102	103	97	95	102
1916	100	106	111	113	114	113	115	119	126	124	127	130	116

WEST LAFAYETTE, INDIANA

No. 53 FEBRUARY, 1930

LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1930

The inventorial estimates of livestock on farms January 1, 1930, show decreases in numbers of horses, mules, and swine, and increases in milk cows, milk heifers, and all cattle.

Horses have declined in number for many years, the present estimated number being 66 per cent of the 1920 number and 96 per cent of 1929. Last December a survey of more than 8,000 farms showed that of the total horses and colts on those farms, 6.8 per cent were foaled in either 1928 or 1929. This indicated that to maintain the present number of horses in the state without in-shipments, the colts foaled within recent years would have to live to an average age of about 30 years. If the number of colts foaled continues at the present level, it is apparent that the number of horses in Indiana will continue to decline until the horse population is approximately one-half of the present number. The reported average value per head of horses and of colts has remained practically unchanged for the past two years. Colts are reported as being valued about 30 per cent higher and horses about 70 per cent higher per head than 5 years ago.

For the past two years mules have decreased in number at about the same rate as horses. The present estimated number is 91 per cent of 1920 and 95 per cent of 1929.

The number of both milk cows and heifers increased 4 per cent during the year. Since 1920 the number of milk cows have increased 10 per cent and heifers have increased 8 per cent. For the first time in the past eight years the average January 1st value per head of milk cows declined. The decline in value per head this year was $1.00. The present average value per head is 48 per cent above the value 5 years ago.

The total number of cattle of all classes increased 2 per cent during the past year and is now estimated as being the largest since 1924 although the present figure is 14 per cent less than the 1920 number. The increase is due to the increases of numbers of milk cows and heifers being kept for milk cows. The number of beef cattle on feed for market on January 1st was estimated to be 95 per cent of the previous January.

The receipts of cattle from Indiana at principal stockyards were 3 per cent less and the receipts of calves 4 per cent less than during 1928.

Sheep increased by 52,000 or 7 per cent during the past year. The number is now estimated to be 33 per cent greater than 5 years ago. The inventorial value per head decreased about 75 cents during the past year and the total inventorial values for the past two Januarys are practically the same.

The receipts of sheep from Indiana at principal stockyards during 1929 were 4 per cent larger than the previous year. The number of sheep shorn in 1929 was 625,000 and 590,000 in 1928. The average weight per fleece was 7.2 pounds in 1929 and 7.3 pounds the previous year. The wool clip of 1929 exceeded that of 1928 by about 4 per cent.

The decrease of 10 per cent in the number of hogs followed the general indications of the previous pig surveys. The number of hogs on farms is now the smallest in a number of years. The receipts of hogs at the principal markets during 1929 were 8 per cent less than during 1928.

The weighted average price per hundred pounds live weight of meat animals, obtained by weighting the monthly farm prices by receipts at principal stockyards, indicated that all prices averaged higher during 1929 than during 1928. The increases per hundred pounds live weight were as follows: beef cattle 44 cents, veal calves 55 cents, hogs 92 cents, lambs 8 cents, and sheep 16 cents.

THE PIG SURVEYS---INDIANA

The June 1, 1929 survey showed 95 per cent as many pigs saved as in the preceding spring from 89.8 per cent as many sows farrowed. The average number of pigs saved per litter was 6.3 compared to 6.0 pigs in 1928. For the 1929 fall crop the December survey showed 89.5 per cent as many pigs saved as in the preceding fall from 89.2 per cent as many sows. Sows for spring farrowing in 1930 were reported as 100.6 per cent of the number which farrowed in the spring of 1929. With the allowance for the decrease usually shown between intentions and farrowings this indicates another decrease of about 5 per cent.
