WEST LAFAYETTE, INDIANA

No. 75 DECEMBER, 1931

CROP SUMMARY FOR INDIANA FOR 1931

During the 1931 crop season weather conditions were comparatively favorable and average or better than average yields were made by most important Indiana farm crops. But the continued contraction of the general price level, accompanied by more drastic declines in the price of farm products, has resulted in greatly reduced farm incomes.

The acreage sown to winter wheat in the fall of 1930 for harvest in 1931 was practically the same as the acreage sown the previous fall. Rainfall during the fall was below normal but above normal temperatures and more than the usual amount of sunshine caused a vigorous growth and the wheat entered the winter in better than average condition. During the winter and spring months, precipitation was below normal and very little leaching occurred, leaving unusual quantities of nitrates available for the wheat plant. Although very little snow fell until March, mild temperatures prevented damage from freezing. The loss of acreage by winter killing was insignificant. Cool weather in May resulted in heavy stooling and good development of heads and rather dry weather conditions were unfavorable for the spread of rust. All of these favorable weather conditions resulted in an unusual heavy growth of straw and the highest per acre yield of winter wheat recorded in the past 65 years.

Rye was sown as an emergency crop on a greatly increased acreage in the fall of 1930. The yield on harvested acreage was slightly above average. The failure of rye to make a very large yield was probably due to a different distribution of the crop on different soil types and cutting for grain of fields which had been heavily pastured.

Oats were sown on about the same acreage as a year ago. The mild winter enabled farmers to prepare the ground early and the crop was sown without much weather interference. The growth of straw was below average. Hot weather in the latter part of June and in July caused some injury to the quality and yield in the northern third of the state. Oats were lighter in weight this year than usual. The yield for the state as a whole was a little better than average.

Corn yielded about 10 per cent more than the ten year average yield per acre. The acreage was slightly increased this year, as there was not enough rain to interfere at planting time. Cool weather early in the season resulted in some poor stands and there was considerable complaint of cut worm and summer insect damage. The latter part of the growing season was warm and the precipitation somewhat above average. The frost date was very late. Consequently a good yield of corn of excellent quality was matured throughout the state. Some damage from dry, hot weather in July resulted in the counties along the Illinois border, north of the Wabash River.

Barley acreage increased materially over last year, particularly in the southern districts, where quick grain feed was needed. The yield per acre was above average and quality about average.

Acre yields of hay were about average. Some acreage shifts among the maior hay crops were noted due to the effects of the 1930 drouth. Mixed hay and clover were both reduced in acreage below what might have been expected and timothy hay increased. The season seemed favorable for alfalfa. Pastures for the season as a whole were a little below average. They suffered from lack of rain during the month of August but mild weather in the fall permitted an unsual extension of the season when pasture was productive.

The acreage seeded to clover in the spring was 1,800,000 acres, about 8 per cent less than the heavy seeding of the previous year. In October there was only 48 per cent of this acreage still standing. The percentage surviving by kinds was: red 49, mammoth 46, and alsike 42.

There was another large increase in the acreage of soybeans. Both hay and grain yields were above average. Cowpea acreage was about the same as a year ago with yields above average.

Tobacco acreage was the same as a year ago. The crop this year yielded better than average and the quality was good. Weather was favorable at harvesting time.

Potatoes made about an average yield, although the range of yields in the state was exceptionally great. Many early potatoes were near failure and late potatoes generally much better.

The clover seed crop was about the same as last year, the yield being much better but the acreage was smaller. Timothy seed production was much larger than a year ago due to a large increase in acreage and a better than average yield.

The past season was unusually favorable for fruit crops. The peach crop was one of the best ever produced in Indiana, yields were exceptionally high and the quality was very good. The apple crop was very large and quality good. Pears made better than an average crop and grapes were about average.

Most truck crops were planted on a smaller acreage this year than last. Onions made a very poor crop. Snap beans and tomatoes for canning were below average in yield. Green peas and sweet corn for canning made better than an average yield. Strawberries, cantaloupes and watermelons yielded much better than last year's short crop.

The acreage of winter wheat sown for the 1932 harvest was 1,428,000 acres, or 85 per cent of last year's sown acreage. December 1st condition at 92 was 7 points above average.

Rye acreage sown for grain is estimated at 124,000 acres, or 97 per cent of last year. Condition December 1st was 92, or 3 points above the ten year average.

1931	37.0	25.9	31.2	14.5	1.15

TABLE VI.

Total Production of Principal Crops Harvested in Indiana for Past Three Years

Year	Corn (Bushels)	Winter Wheat (Bushels)	Oats (Bushels)	Rye (Bushels)	Tame Hay (Tons)
1929	131,843,000	25,624,000	53,352,000	1,120,000	2,459,000
1930	117,009,000	28,242,000	57,211,000	1,088,000	1,416,000
1931	168,535,000	43,072,000	61,339,000	1,827,000	2,017,000

The data in the following tables were published originally in Purdue University Agricultural Experiment Station Bulletin No. 320, "Prices of Farm Products in Indiana." According to the plan presented in this bulletin the data will be brought up to date and published annually in "Indiana Crops and Livestock." A copy of the original publication may be obtained from the Experiment Station.

TABLE VII. INDIANA INDEX NUMBER OF FARM PRICES

Based on Indiana farm prices for 17 products on the fifteenth of each month (1910 to 1914=100)

Year	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Yearly Average
1910	107	107	112	110	106	104	102	99	104	100	95	93	103
1911	93	89	86	83	81	82	86	92	95	91	90	91	88
1912	94	96	97	104	106	104	100	100	102	102	96	95	100
1913	95	98	102	107	100	102	104	105	107	106	105	103	103
1914	105	107	107	106	105	95	104	111	114	107	101	102	105
1915	105	104	103	105	108	105	102	100	102	103	97	95	102

ANNUAL LIVESTOCK SUMMARY

1931

DEPARTMENT OF AGRICULTURAL STATISTICS
WEST LAFAYETTE, INDIANA

No. 65

FEBRUARY, 1931

LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1931

The inventorial estimates of livestock on farms January 1, 1931, show decreases in numbers of horses and swine, increases in numbers of milk cows, milk heifers, all cattle and sheep, while numbers of mules are the same as a year ago.

The total value of each of the species of livestock declined sharply during 1930 due to the drop in value per head. The total value of all livestock on Indiana farms on January 1, 1931 was $132,619,000 compared with $177,861,000 on January 1, 1930.

Horse numbers again declined at about the same rate as in the past few years. The present numbers are 5 percent less than last year and 38 percent less than in 1920. The value of horses and colts on Indiana farms declined from $82.00 per head on January 1, 1930 to $76.00 per head on January 1, 1931.

For the first time in three years mule numbers did not show a decrease but are still 9 percent less than in 1920. The value per head is $5.00 lower than a year ago.

The total number of cattle of all classes increased 2 percent during the past year and is now estimated as being the largest since 1923 but cattle numbers are still 12 percent less than in 1920. The increase is due to larger numbers of milk cows, and heifers kept for milk cows. The number of beef cattle on feed for market on January 1st was estimated to be 80 percent of the previous January.

The Indiana dairy industry has been expanding for several years. Numbers of milk cows are now 3 percent greater than a year ago and 13 percent greater than in 1920. Numbers of milk heifers increased 9 percent since last January and are 18 percent greater than in 1920. The total value of milk cows on Indiana farms declined $21,185,000 during the past year, this amounted to $31.00 per head, and the value now is $4.00 less per head than in 1925.

The receipts of cattle from Indiana at principal stockyards during 1930 were practically the same as in 1929 and receipts of calves increased 10 percent.

Sheep numbers have increased every year since 1922. The number on January 1, 1931 is 800,000, an increase of 4 percent over a year ago, and is 47 percent greater than in 1922. The receipts of sheep from Indiana at public stockyards during 1930 were 16 percent larger than during 1929. The estimated number of sheep and lambs on feed January 1st 1931 shows a decrease of 23,000 head from a year ago.

During 1930, sheep values declined more sharply than any class of livestock. The average value of all sheep and lambs on January 1, 1931 is $5.60 per head compared with $10.50 per head on January 1, 1930. These values are lower than any time since 1922.

Hog numbers have decreased since 1928. Present inventorial numbers are 95 percent of a year ago and 78 percent of January 1, 1928. Hog marketings during 1930 were 13 percent less than in 1929.

The weighted average price per hundred pounds live weight of meat animals, obtained by weighting the monthly farm prices by receipts at principal stockyards, showed sharp reductions in the prices received by Indiana farmers for all classes of livestock. The decreases per hundred pounds live weight of 1930 marketings compared with 1929 were as follows: beef cattle $1.90, veal calves $3.01, hogs 62 cents, lambs $3.91, and sheep $1.97.

When the numbers of all livestock are combined into units which allow for differences in size and feed requirements among the several species the total number of animal units on Indiana farms on January 1, 1931 was practically the same as on January 1, 1930. But feed supplies are shorter than at any time during the past several years. The supplies of hay and feeding grains in Indiana for the seasons following the crops of 1929 and 1930 respectively, were: all hay 3,875,000 tons, and 2,553,000 tons. Corn, 136,702,000 bushels, and 114,156,000 bushels. Oats 59,852,000 bushels, and 60,120,000 bushels. Barley 855,000 bushels and 968,000 bushels. The exceptionally mild winter has materially helped to conserve this years feed supplied.

MINER M. JUSTIN,
Agricultural Statistician.

C. D. PALMER,
Asst. Agricultural Statistician.

THE PIG SURVEYS—INDIANA

The June 1, 1930 pig survey showed 88.0 percent as many pigs saved as in the preceding spring from 86.8 percent as many sows. The average number of pigs saved per litter was 6.4 compared with 6.3 in 1929. For the 1930 fall crop the December survey showed 98.0 percent as many pigs saved from 96.1 percent as many sows. The average number of pigs saved 6.4 per litter compared with 6.3 in the fall of 1929. These surveys indicate that the total 1930 Indiana pig crop was about 8 percent smaller than in 1929. Sows intended for farrowing in the spring of 1931 are reported 108.4 percent of those farrowing in 1930. If actual farrowings bear the same relation to intentions as in past years the number of sows farrowed in the spring of 1931 will probably be slightly more than last year.
