WEST LAFAYETTE, INDIANA

No. 87 DECEMBER, 1932

CROP SUMMARY FOR INDIANA FOR 1932

The acreage sown to winter wheat in the fall of 1931 was 14 per cent less than that sown the previous fall. Due to lack of cash and low prices received for the 1931 crop, less than the usual amount of fertilizer was used but extremely favorable growing weather resulted in a very rank growth and a reported condition of 92 per cent of normal on the first of December. The December 1, ten year average condition is 86. Temperatures were considerably above normal from September through February and the average precipitation for the state was above normal from September through January. Severe cold weather set in on the 5th of March and up until the 16th of the month the mean temperature was down close to zero. Although many wheat fields were turned brown, considerable portions of the state had a light snow cover during the cold weather and no material damage to the crop was evident on the first of May. The month of May was very dry and drouth caused considerable damage in the southern part of the state. Hessian fly infestation was heavier than for several years in the south and along the western side of the state as far north as the Kankakee river. An average yield for the state as a whole was obtained, the very poor yields in the south being offset by better than average yields in the northern and eastern sections. The acreage actually abandoned for the state as a whole was only 3 per cent of sowings.

Rye for all purposes was sown on a 7 per cent smaller acreage in the fall of 1931 than in the fall of 1930. Rye was affected to a considerable extent by the same weather factors as wheat. Lack of moisture in May reduced yields in the south and in the sandy area in the northwest and north central part of the state. It is probable that more than the usual percentage of the acreage that was cut for grain was also utilized for pasture.

There was a small increase in the acreage planted to oats. The mild winter enabled farmers to do more than the customary amount of plowing and oats seeding was started early in February but due to the extremely cold weather in March extended over a longer period than usual. Precipitation for the state was below normal from February through May. Oats suffered from dry weather during May and most of June. Rain the latter part of the month helped the northern but was too late for the southern part of the state. Oats were headed shorter than usual this year and were not filled well in many sections. There was some frost damage in May in the Kankakee valley. Yields were about average for the northern two-thirds of the state but below average in the southern third.

The estimated corn acreage was 2 per cent below the previous year. Corn planting was delayed somewhat by rains the last day of April and the average planting date was 4 days later than in 1931. May and June were favorable for field work and stands were good and fields unusually clean on the first of July. Although the crop was retarded by drouth in August in the eastern part of the state, yields were about average in this section and better than average in many sections of the state. The average yield for the state is below last year but above the ten year average. In general, the quality of the crop is good although more than the usual amount of mold and ear worm damage was reported in sections of the northwestern part of the state. Practically all of the crop was past frost damage by October 1st and more than the usual amount was cribbed by November 1st.

The production of barley was below a year ago due to smaller yields. Barley was affected by the dry weather in May and June and the average yield was below last year and slightly below the ten year average.

The total acreage of all tame hay was practically the same as a year ago. The average yield was higher due to an increase in acreage of the higher yielding hays, alfalfa and annual legumes, and decreases in the acreage of other hays. Many clover fields were quite weedy this year.

For the third successive year clover stands were poor. In October only 59 per cent of the seeded acreage was still standing. The percentage surviving by kinds was: red 58, mammoth 64, and alsike 65. Pastures were unusually poor this year, the reported condition for the state was below last year and the ten year average every month from May to October. The northeastern and east central part of the state was particularly affected by the August drouth and many fields on the first of September furnished no feed at all. Ample rains during September caused a marked improvement in the condition of pastures.

Soybeans were planted on a slightly reduced acreage this year. The acreage cut for hay was above last year but the grain acreage was sharply reduced. The price of beans was very low last year and no price had been established until after hay cutting time. Total production of threshed soybeans was about 72 per cent of last year. The acreage of cowpeas both for grain and hay was above last year and yields were below a year ago.

Tobacco acreage was cut about 35 per cent this year. Yields of both burley and dark types were considerably reduced. This year's crop is only about 54 per cent of last year's. The quality of the crop was good.

The potato acreage is 5 per cent above last year and for the whole crop the yield was average. There was a great deal of variation in yields. Early potatoes suffered from drouth but rains came in time to be of material benefit to late potatoes.

The crop of clover seed was unusually good this year. The cut acreage was about 55 per cent larger than a year ago. The average yield was 1.5 bushels as compared with 1.0 bushels last year. Weather conditions were very favorable at harvest time. Timothy seed production was below last year due to a decreased acreage.

The near failure of tree fruits in the southern part of the state was in striking contrast to last year's bumper crop. The sharp March freeze following extremely warm weather in February killed peach buds in large areas in the southern part of the state and extended into the central section. Apples and pears were also damaged. The northern third of the state had nearly an average crop of apples, peaches and pears but the total production was greatly reduced as the greater number of bearing trees are in the south. Grapes made about an average crop.

The total acreage of all truck crops was reduced for the second year in succession. Although the acreage was cut, cabbage yielded better than last year and total production was only slightly below last year. Sweet corn for canning acreage was only about one-half of last year and the yield was the same. Production of canning tomatoes was above last year due to better yields. Both acreage and yield of canning peas was below a year ago. The acreage of snap beans for canning was reduced sharply but the yield was much better than last year.

Peppermint acreage was reduced sharply. Dry weather, freezes, and insects caused abandonment of considerable acreage. The estimated yield is below a year ago.

Onion acreage was increased and the yield per acre was over twice that of last year's poor crop.

The acreage of winter wheat sown for the 1933 harvest was 1,539,000 acres, or 104 per cent of last year's sown acreage. December 1st condition was 83 per cent of normal, 3 points below average.

The acreage of rye sown for all purposes is estimated at 189,000 acres, the same as last year's sown acreage. The acreage sown for all purposes in the fall of 1930 was 203,000 acres. The past two years only about one-half of the acreage sown has been harvested for grain, the other half being utilized for pasture, hay and cover crop. The condition of rye on the first of December was 85 per cent of normal, 4 points below average.

The data in the following tables were published originally in Purdue University Agricultural Experiment Station Bulletin No. 320, "Prices of Farm Products in Indiana." According to the plan presented in this bulletin the data will be brought up to date and published annually in "Indiana Crops and Livestock." A copy of the original publication may be obtained from the Experiment Station.

TABLE VII. INDIANA INDEX NUMBER OF FARM PRICES

Based on Indiana farm prices for 17 products on the fifteenth of each month (1910 to 1914=100)

Year	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Yearly Average
1910	107	107	112	110	106	104	102	99	104	100	95	93	103
1911	93	89	86	83	81	82	86	92	95	91	90	91	88

ANNUAL LIVESTOCK SUMMARY

1932

DEPARTMENT OF AGRICULTURAL STATISTICS
WEST LAFAYETTE, INDIANA

No. 77 FEBRUARY, 1932

LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1932

The inventorial estimates of livestock on farms January 1, 1932, show larger numbers of milk cows, all cattle, all sheep and swine, and smaller numbers of horses and mules compared with a year ago. There was a small decrease in the number of yearling heifers being kept for milk cows.

When the numbers of all livestock are combined into units, which allow for differences in size and feed requirements among the several species, the total number of animal units on January 1, 1932, was about 4 per cent larger than on January 1, 1931. Feed supplies are much larger than a year ago.

In spite of the increased numbers of all livestock, declining prices have drastically reduced inventory values. The total value of all livestock on Indiana farms on January 1, 1932, was $104,322,000, compared with $131,105,000 on January 1, 1931, and $174,563,000 on January 1, 1930.

The trend of horse numbers continued downward. The present number is about 3 per cent less than a year ago and 41 per cent less than in 1920. Mule numbers are about 3 per cent less than a year ago. The value of horses and mules has declined less in the past two years than other classes of livestock. The value per head of all horses was $82.00 on January 1, 1930; $76.00 on January 1, 1931, and $73.00 on January 1, 1932. The value per head of all mules was $89.00 on January 1, 1930; $83.00 on January 1, 1931, and $77.00 on January 1, 1932.

Cattle numbers continued the upward trend which was first shown on January 1, 1927, and are now 5 per cent larger than last year but still about 8 per cent less than the 1920 numbers. The increase this year was due to larger numbers of milk cows and calves and a larger number of cattle on feed. The number of cattle on feed for market on January 1st was estimated to be 120 per cent of the previous January.

The value of all cattle declined from $42.50 per head on January 1, 1931, to $30.40 on January 1, 1932. Two years ago the value per head was $66.00. The value of milk cows has declined $45.00 per head in the past two years and is now $14.00 less than on January 1st last year.

Receipts of cattle from Indiana at public stockyards during 1931 were about 6 per cent less than in 1930, most of the decrease being in the last four months of the year. The receipts of calves were about one per cent greater than the previous year.

Total sheep numbers are about 2 per cent greater than a year ago. This is due to greater numbers on feed for market. The inventorial estimate of stock sheep is a little below that of last year. The value per head of all sheep and lambs was $4.00 on January 1, 1932, compared with $5.70 last January and $10.50 two years ago.

The lamb crop in 1931 was about 10 per cent larger than in 1930, due both to a larger number of ewes and a larger proportion of lambs were saved. Receipts of sheep and lambs at principal stockyards during 1931 were 5 per cent greater than in 1930. The amount of wool shorn in 1931 was about 8 per cent greater than in 1930. The average weight per fleece was 7.4 pounds in 1931 and 7.2 pounds in 1930.

Hog numbers show an increase over the previous year for the first time since 1928. Present numbers are 10 per cent larger than a year ago. Most of the increase is in fall pigs and sows and gilts. The very low price of corn made the corn-hog ratio comparatively favorable for hog feeding during the last six months of 1931. Receipts of hogs from Indiana at principal stockyards during 1931 were one per cent less than in 1930 and the smallest since 1926.

The weighted average price per hundred pounds live weight of meat animals, obtained by weighting the monthly farm prices by receipts at principal stockyards, again showed sharp reductions in the prices received by Indiana farmers for all classes of livestock. The decrease per hundred pounds live weight of 1931 marketings compared with 1930 were as follows: beef cattle $2.39, veal calves $3.27, hogs $3.19, lambs $1.99, and sheep $1.53.

THE PIG SURVEY—INDIANA

The June 1st, 1931, pig survey showed 98.8 per cent as many pigs saved as in the spring of 1930. The average number of pigs saved per litter was 6.4, the same as the previous year. The December, 1931, survey showed 108.5 per cent as many pigs saved as in the fall of 1930. The average number of pigs saved per litter was 6.3 compared with 6.4 in the fall of 1930. These two surveys indicate that the total 1931 pig crop was about 3 per cent greater than in 1930. Sows intended for farrowing in the spring of 1932 are reported as 120.9 per cent of those farrowed in the spring of 1931. From the relationship of intentions to actual farrowings in past years, an increase of about 12 per cent in the coming spring's pig crop over that of last year is indicated, provided the normal number of pigs per litter are saved.
