DEPARTMENT OF AGRICULTURAL STATISTICS
WEST LAFAYETTE, INDIANA

No. 147

December, 1937

Winter wheat was seeded in the fall of 1936 on 2,300,000 acres. This was an increase of 22 per cent over the previous year and was the largest seeded acreage since the fall of 1927. Seed bed preparation was retarded by the hot dry weather of July and early August in 1936, and seeding was somewhat delayed by rains late in the fall. Winter conditions were somewhat less favorable than usual. Excessively heavy precipitation in January, 1937, was followed by considerable freezing and thawing in February and March. Winter-killing losses amounted to 6 per cent of the acreage. This was near the ten year average loss but much above recent years. On June 1 the crop made a very promising appearance. Shortly after that date black stem rust became visible in epidemic form. Yields and quality of grain were sharply lowered over most of the state. In the two southern tiers of counties the damage was less intense, and wheat on sandy ground in the northern part of the state suffered less extremely than acreage in the central portion of the state. Along with low yields much wheat made very low test weights. These ranged from 35 pounds per bushel upward, but probably one-fourth the wheat tested less than 50 pounds per bushel. Much of this was fed, the feed value being greater than the milling value. Production was estimated as 34,592,000 bushels or 16.0 bushels per acre on 2,162,000 acres.

Rye was seeded on 318,000 acres in the fall of 1936. This was much above average. The drought of 1936 made rye for pasture and early grain in 1937 especially desirable. The production of 2,025,000 bushels by a yield of 12.5 bushels per acre on 162,000 acres made the crop almost twice as large as average. The 52 per cent of the acreage harvested for grain is also an unusually large proportion of the crop. Rarely in the past has more than 45 per cent of the acreage been harvested as grain.

The oats acreage was not greatly changed in 1937. Presumably farmers refrained from increasing the acreage of this grain because of low yields in the last several years. Intended seeding was accomplished in the southern and central portions of the state largely in mid-April when a period of fair weather permitted farm work to progress rapidly. In the northern part of the state the soil was very wet throughout April and planting intentions were not completely realized. Yields and quality of oats were extremely variable over the state. Seasonably seeded oats made good yields of good to excellent grain. Late seedings, and others damaged by rust, made only low yields of light grain. The acreage harvested was 1,483,000 and the yield 31.0 bushels per acre, making 45,973,000 bushels estimated production.

Corn prices at planting time in 1937 were high, and a sharp increase in corn acreage was made. Grass seedings lost in the 1936 drought and conservative seedings of oats left liberal acreage available for corn. Except in the northeastern part of the state the weather did not limit planting of corn. Everywhere, however, there was a threat of fields becoming too wet. Alertness of growers, taking advantage of favorable days, and increasing use of power machinery to meet peak loads, enabled producers to plant a large acreage. For the first time an appreciable acreage was planted with hybrid seed, though the actual extent of the use of such seed was not determined.

The period for cultivating corn was rather wet and many fields, especially in the northeast district became weedy and grassy. Drought threatened in the Southwest district in late July. Ample rains in August, with favorable temperatures following permitted the crop to make a wonderful finish of the season's growth. Yields were above the ten year average in every district except the Northeast and for the state as a whole the yield was the highest on record. The estimated yield of 45.0 bushels per acre, on the 4,706,000 acres gave a production of 211,770,000 bushels. Only in 1925 was more corn ever produced in the state in a single season.

Barley was harvested from 27,000 acres in 1937. The increasing proportion of the acreage which is winter barley resulted in a higher

yield than condition figures would indicate. The spring barley in the northern part of the state was more adversely affected by wet weather and rust than the winter barley in the Southwestern district.

The acreage of buckwheat was estimated as 12,000. The use of this crop to meet specifications in the Soil Conservation Program may have had some effect in maintaining the acreage.

Tame hay acreages were badly distorted by adverse weather conditions of 1936 and 1937. The drought of 1936 destroyed most of the new clover seeded in the spring which would ordinarily have been the hay of 1937. Freezing and thawing killed considerable acreages of alfalfa, and the clover from mixed hay stands. These acreage losses were only partly replaced by new seedings of alfalfa, or the utilization of soy beans. High yields of hay permitted the production of hay to reach 2,320,000 tons or 296,000 more than the 1928-1932 average, while the acreage of tame hay was 303,000 less than in 1936. Much rain-damaged hay was put up in the East and Northeast districts in July. Lespedeza which was too short to cut in 1936 made an unusually heavy crop on an increased acreage.

Soybeans were seeded on 812,000 acres in 1937, an increase of 8 per cent. Of the total, 341,000 were harvested for beans, 365,000 for hay, and 106,000 were grazed or plowed under. The yield of beans was 17.0 bushels per acre, making production 5,797,000 bushels, nearly three times the 1928-1932 average. Soybean hay made very good yields and this undoubtedly permitted more acreage to be harvested for beans. The other utilization was much less than in 1936 when drought rendered many fields useless for harvest in ordinary ways.

Cowpeas had an acreage of 29,000; 6,000 were harvested for peas, 20,000 for hay, and 3,000 grazed or plowed under.

Potatoes with acreage reduced to 54,000 made the best yield for several years and produced 5,400,000 bushels.

Excessive moisture was detrimental to potatoes in the muck section early in the season and growth was stopped rather prematurely in limited areas by frost.

Sweet potatoes also had an unusually favorable season. The acreage was at the usual level.

The acreage of tobacco was increased 67 per cent over 1936 plantings. The increase was all burley tobacco. High prices for the 1936 crop was the stimulus. Good stands were secured and the tobacco made good yields. Quality was also good.

Tree fruits made an extraordinarily good crop. Apples yielded heavily, even neglected and dying trees producing large quantities of fruit. Peach orchards made an excellent crop but the number of trees is still low, as young trees have not yet replaced the losses of 1936. Pears were the largest crop for many years. Grape production was also above average.

Truck crops produced about average yields. The acreage of sweet corn, snap beans, canning peas were considerably larger than the previous year. Tomato acreage was smaller. Watermelons, canteloupes, and strawberries occupied slightly larger acreages. Onion and peppermint acreage were reduced.

Winter wheat seeded in the fall of 1937 for the 1938 harvest totaled 2,024,000 acres or 88 per cent of the previous year. The reduction was probably due mainly to more adequate seedings of new clover, and the unsatisfactory returns from rusted wheat in 1937. Wet weather after the fly free date retarded seeding and may have curtailed intended sowings to a slight extent. Condition on December 1 was 81, four points below the ten year average (1923-1932). Late fall growth was limited by cool weather.

Rye was sown on 207,000 acres in the fall of 1937. The reduction in acreage to 65 per cent of 1936 was due to the absence of emergency conditions which caused the sowing of a large acreage for pasture and early grain the previous year. Condition December 1 was 86, two points below the 1923-1932 average.

MINER M. JUSTIN, Senior Agricultural Statistician.
ROBERT E. STRASZHEIM, Associate Agricultural Statistician.

TABLE I.

Summary of The Acreage and Production of Indiana and United States Crops—1937-1936.

Crop and Year	Indiana			United States		
	Acreage	Production		Acreage	Production	
		Yield Per Acre Bushels	Total Bushels		Yield Per Acre Bushels	Total Bushels
Corn:						
1937	4,706,000	45.0	211,770,000	93,810,000	28.2	2,644,995,000

The data in the following tables were published originally in Purdue University Agricultural Experiment Station Bulletin No. 320, "Prices of Farm Products in Indiana." According to the plan presented in this bulletin the data will be brought up to date and published annually in "Indiana Crops and Livestock." A copy of the original publication may be obtained from the Experiment Station.

TABLE V—INDIANA INDEX NUMBER OF FARM PRICES

Based on Indiana farm prices for 17 products on the fifteenth of each month (1910 to 1914=100)

Year	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Yearly Average
1910	107	107	112	110	106	104	102	99	104	100	95	93	103
1911	93	89	86	83	81	82	86	92	95	91	90	91	88
1912	94	96	97	104	106	104	100	100	102	102	96	95	100
1913	95	98	102	107	100	102	104	105	107	106	105	103	103
1914	105	107	107	106	105	95	104	111	114	107	101	102	105
1915	105	104	103	105	108	105	102	100	102	103	97	95	102
1916	100	106	111	113	114	113	115	119	126	124	127	130	116

ANNUAL LIVESTOCK SUMMARY

1937

DEPARTMENT OF AGRICULTURAL STATISTICS
WEST LAFAYETTE, INDIANA

No. 137 FEBRUARY, 1937

LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1937

The estimates of numbers of livestock on Indiana farms January 1, 1937, showed increases for hogs and milk heifers from one to two years old, decreases for all sheep, all cattle and milk cows two years old and over, and the same numbers for horses and mules.

Changes in numbers as estimated for both Indiana and the United States are shown in percentages as follows: horses remained the same in Indiana, decreased in the United States, .9 per cent; mules remained the same in Indiana, decreased in the United States, .7 per cent; all cattle decreased in Indiana 2.0 per cent, in the United States, 1.9 per cent; milk cows decreased in Indiana 1.0 per cent, in the United States, 1.6 per cent: swine increased in Indiana 10.0 per cent, decreased in the United States, .1 per cent; stock sheep and lambs decreased in Indiana 5.0 per cent; increased in the United States, 1.6 per cent; sheep and lambs on feed decreased in Indiana 8.9 per cent, in the United States, 3.6 per cent.

In Indiana, the value per head was greater for all species of livestock except sheep and hogs; the total value, larger except for sheep. In the United States, the value per head was greater for horses, mules and milk cows and less for all cattle, sheep and hogs. The total value of all classes in the United States was greater for horses, mules and milk cows and less for all cattle, sheep and hogs.

Milk cows two years and over in Indiana are now fewer in number than in any of the last four years. Milk heifers, from one to two years old, are greater in numbers than in any year back to and including 1921.

The percentage of cows in herds being milked, was larger than in 1935 in most months of 1936, especially near the end of the year. This suggests that dry cows were culled rather closely throughout the year as drought reduced the feed furnished by pastures. The effect of drought damaged pastures is further indicated by lower production per cow milked through the summer months of 1936 than in 1935. This low level of production extended from March to September inclusive. This period also shows butter and butterfat prices higher than in 1935 by from 1 to 11 cents per pound.

Receipts of Indiana cattle at the principal stockyards in 1936 showed a 10.5 per cent increase over 1935. Calves received declined 5.4 per cent. The average price of milk cows advanced from $49.00 to $51.00 and the average per head value of all cattle from $38.40 to $39.70.

The principal stockyards reported receiving 12.3 per cent more hogs from Indiana than were received in 1935. The average value per head of hogs on farms declined from $13.50 to $12.80.

Estimates of spring farrowing were 113 per cent and fall farrowings 117 per cent of the respective farrowings in 1935. The estimate of sows to farrow in the spring of 1937 is 99 per cent of the number farrowing in the spring of 1936.

Indiana stock sheep showed a 5.0 per cent decrease while Indiana sheep and lambs on feed were 8.9 per cent less than a year ago. In the 1936 season, 583,000 ewes in the state produced 624,000 lambs, a 107 per cent lamb crop, while in 1935 the percentage was 112.

The estimated number of Indiana sheep shorn in 1936 was 745,000; in 1935, 744,000 head; in 1934, 715,000 head. Wool clipped amounted to 5,215,000 pounds; in 1935, 5,729,000 pounds; in 1934, 5,362,000 pounds. Average fleece weight was 7.0; in 1935, 7.7; in 1934, 7.5 pounds. Monthly wool prices were higher for every month than for the corresponding months in 1935. This increase varied from 3 cents a pound in January and November to 12 cents in May.

Indiana sheep received at the principal stockyards in 1936 were one per cent greater in number than in 1935. The average value of stock sheep and lambs on farms declined from $7.30 to $6.80.
