INDIANA CROP SUMMARY FOR 1940

The 1940 crop season began with the turn to less than average precipitation the latter part of August 1939. September continued very dry and preparation of seed beds for fall grains was made difficult. The dry weather was reported also to have delayed emergence of the late brood of Hessian fly thus making the fly free date for winter wheat later than usual, but the delay in emergence also caused heavy mortality of the dormant insects. Winter wheat was seeded in dry ground but rains in late October were sufficient for germination although fall growth was smaller than usual. The acreage seeded to winter wheat for the 1940 harvest was 1,569,000 or 3 percent less than was seeded the previous year. Because of the dry fall the wheat was small December 1, 1939 and the condition was reported considerably below average. The crop was covered with snow when the lowest temperature of the winter came, and there was no excess moisture in the period of freezing and thawing. Winter losses were therefore nominal amounting to only 1 percent leaving 1,540,000 acres for harvest.

The prospective yield improved steadily from the beginning of growth till July 1st. At that date black stem rust was epidemic and heavy damage seemed likely. A turn to dryer, cooler weather at this time seemed to arrest the development of the rust and the final yield of 19.5 bushels per acre was among the high yields in the history of the state. Production was 30,030,000 bushels.

The acreage of rye seeded for all purposes in the fall of 1939, was 224,000 acres which was 15 percent below the previous year. Only 119,000 acres were harvested for grain, the rest being pastured or otherwise used. The yield of 15.0 bushels per acre is unusually high. The estimated production in 1940 was 1,785,000 bushels.

The early spring of 1940 was cool and dry, with the late spring cool and wet. This sort of weather was a handicap in getting corn ground prepared where only horses were available for power. Only a small part of the corn acreage was still unplanted by the end of May. June brought many rainy days which interfered with cultivation and caused more weedy and grassy fields of corn than usual. July became very dry by the end of the month with some really hot days. Some corn was injured so much at the time of tasselling that ears were not produced. This was made worse by the continuation of the dry hot weather to mid-August when showers were rather wide spread. The precipitation was more in showers than general rains so the effect on corn was strikingly lacking in uniformity. September continued the dry weather but was cool with killing frost rather general on the 26th.

The acreage of corn was reduced 5 percent to 3,937,000. There was some land intended for corn which did not get planted because of weather, especially in the southern districts, but most of the reduction was due to participation in the adjustment program.

The acreage sown to oats was 1,154,000 acres or 10 percent less than the previous crop. The acreage harvested for grain was 10 percent larger than last year since there was less need for supplementary hay, and pasturing was less attractive with a more favorable season. The yield per acre of 45.0 bushels is the highest on record for the state though production of 49,950,000 bushels is not greatly above average.

Barley was harvested from 50,000 acres, which is 7,000 more than last year. The yield of 29.0 bushels per acre is exceptionally high and the production of 1,450,000 bushels is more than twice the average of the preceding 10 years. The shift to winter barley has been rather general and this has changed the former relation of barley yields to the climatic conditions.

Buckwheat with a yield at the 10 year average of 13.5 bushels per acre produced 94,000 bushels on the 7,000 acres grown.

Soybeans were planted on 1,508,000 acres in 1940. Of these 814,000 were harvested for beans, 453,000 for hay, and 241,000 acres were grazed or plowed under. The dry weather injured beans at blooming time, and there were too many weeds in the fields for much recovery after the rains came. The yield of beans was 13.5 bushels the lowest for several years. Production of 10,989,000 bushels was about 3,500,000 less than last year's record production.

Cowpeas were planted on 40,000 acres. The 10,000 acres harvested for peas yielded 7.5 bushels per acre making production 75,000 bushels. This yield is below average since the effect of the midsummer drought was rather severe in the southwest district of the state where this crop is mostly grown.

The potato acreage was 51,000 acres or 3,000 more than last year. The unfavorable weather of midsummer and the early frost reduced yields to 85 bushels per acre. This is 10 bushels lower than last year but only 1 bushel below the average for 1929-38. Production is estimated as 4,335,000 bushels.

Sweet potato acreage was again 3,000 but the adverse weather cut the yield to 100 bushels per acre which is slightly lower than last year or the average of recent years.

Tobacco acreage was reduced by the adjustment program to 11,400 acres. A yield of 897 pounds per acre was secured in spite of rather unfavorable weather. Production of 10,222,000 pounds is only slightly below the average for 1929-38.

The production of all hay in 1940 was 2,833,000 tons. Alfalfa showed no change in acreage and little in production from last year. Clover and timothy hay made a yield 28 percent above the 1929-38 average and the acreage was much larger because of more successful seeding in 1939. Grain hay was little changed from last year in acreage but yield was exceptionally good.

The acreage of soybean hay was considerably reduced this year although the acreage of soybeans increased. The yield of soybean hay was usually low as dry weather stunted the growing beans. Cowpeas also made a smaller yield than usual but the acreage for hay was larger than last year. Lespedeza hay production was less than half the previous year, due mainly to a reduced acreage. About half the lespedeza intended for hay did not get tall enough to be cut for hay. The total acreage of all hay was 2,177,000 or about 10 percent larger than in 1939 and nearly 16 percent larger than the 1929-38 average.

The acreage of red clover seed at 399,000 acres set a new high record. The yield was only .9 bushels per acre but production at 359,000 bushels is more than twice the average crop. Alsike clover seed is also at a high level of acreage though the yield was not high at 1.2 bushels per acre.

The dry weather of midsummer was favorable for setting alfalfa seed and 16,600 acres were harvested. The yield was slightly below average at .9 bushels.

Both acreage and yield of timothy seed were high. With 40,000 acres making 3.5 bushels per acre, production was 140,000 bushels.

Sweet clover seed made good yields but the acreage was much lower than last year. Production at 16,200 bushels was only 10 percent lower than in 1939.

Lespedeza seed was reduced in both acreage and yield by the dry weather which limited growth so much that a good deal of the expected seed could not be harvested.

The apple crop in commercial counties was estimated as 1,225,000 bushels, where 1939 was 2,075,000 bushels and the 1934-38 average was

1,464,000 bushels. The severe winter weather of January 1940 was reported to have destroyed some buds.

The 1940 peach crop was very small and was largely in the northern part of the state where there are few commercial orchards. Cold weather in January killed most of the buds, but relatively little wood was injured.

Pears made a good crop though somewhat smaller than in 1939. Grapes were about an average crop. Early season prospects were reduced by the drought limiting the size of the berries.

Truck crop yields were mostly average or better in 1940. Sweet corn was an exception, making a very low yield. Acreage changes from the previous year were pretty well balanced between crops. The increase in sweet corn was offset by a decrease in tomatoes. The total acreage for the state was not greatly changed.

Pasture made a rather slow start but was very good until mid July and very poor from August 1 to the end of the season.

The winter wheat crop for 1941 was seeded a little later than usual. The dry weather of August and September hindered preparation of seed beds somewhat and caused some delay. Moisture after seeding was sufficient though moderate in amount. An increase of 2 percent in the acreage seeded made the acreage 1,600,000. This had a condition December 1, 1940 of 89, or 3 points above the average of 1928-37.

Rye for all purposes seeded in the fall of 1940 amounted to 246,000 acres, an increase of 10 percent over the 1939 seeding. The condition December 1 was 90 percent of normal or 2 points above the 1928-37 average.

MINER M. JUSTIN, Senior Agricultural Statistician.
ROBERT E. STRASZHEIM, Agricultural Statistician.

The first part of the following tables were published originally in Purdue University Agricultural Experiment Station Bulletin No. 320 "Price of Farm Products in Indiana." According to the plan presented in that bulletin the data are brought up to date and published annually in "Indiana Crops and Livestock." The table on "Purchasing Power of Livestock per Head in Indiana" formerly in the Crop Summary issue, in the future will appear in the Livestock Summary issue.

TABLE V—INDIANA INDEX NUMBER OF FARM PRICES

Based on Indiana farm prices for 17 products on the fifteenth of each month (1910 to 1914 = 100)

Year	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Yearly Average
1910...	107	107	112	110	106	104	102	99	104	100	95	93	103

ANNUAL LIVESTOCK SUMMARY

1940

**DEPARTMENT OF AGRICULTURAL STATISTICS
WEST LAFAYETTE, INDIANA**

LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1940

Estimated numbers of cattle and hogs on Indiana farms January 1, 1940, are larger than last year, while numbers of horses, mules and sheep are less.

Work stock continues the long time decline in numbers, coincident with increase in tractors and trucks and fewer crop acres. There are 4 per cent fewer horses and 1 per cent fewer mules than last year. The number of colts reported does not yet suggest that the end of the decline has been reached.

Total cattle increased 6 per cent the past year to 1,748,000 head, the largest number since 1890. The number of calves raised was large, and inshipments exceptionally heavy. Two-thirds of the increase is in beef animals, evenly divided between cows, calves, and steers. Milk cows increased 1 per cent the past year. Young dairy animals increased more than milk cows, suggesting probable further expansion of dairying.

The increase of 23 per cent in hogs brings the number to 4,189,000 head, the largest holding for this date in the history of the state. There are sows on hand to make a further increase, but with feeding advantage declining the extent to which production will expand has become uncertain.

Stock sheep increased 2 per cent to 714,000 head, almost balancing the decrease of feeders to 190,000 from 206,000. Most of the stock sheep increase was breeding ewes.

Values per head were higher this year than last for cattle and sheep, but lower for horses, mules, and hogs. The decline for hog value was exceptionally sharp.

The number of chickens at 16,211,000 head is 1 per cent greater than last year. This is still slightly less than the 1929-38 average. The number of turkeys is 155,000 or 17 per cent more than last year, and over twice the average number.

The wool crop of 1939 was 5,190,000 pounds from 692,000 fleeces averaging 7.5 pounds each. Production was 6 per cent larger than in 1938.

UNITED STATES

Meat animals have increased the past year. The number of hogs is 18 per cent larger; cattle 3 per cent; sheep 1 per cent; chickens 4 per cent; turkeys 33 per cent.

The number of work stock—both horses and mules—continued the downward trend of the past twenty years. Horses are fewer by 2 per cent, and mules by 1 per cent.

The 1939 pig crop of 84,302,000 head is the largest of record, and is 19 per cent greater than that of 1938.

The 1939 lamb crop of 31,867,000 head was 1 per cent smaller than the record crop of 1938.

Production of shorn wool in 1939 was 375,699,000 pounds or 1 per cent more than last year.

The total number of chickens January 1, 1940, was 429,022,000, compared with 412,604,000 a year ago, and the average of 1929-38 of 428,054,000.

MINER M. JUSTIN,
Senior Agricultural Statistician.

ROBERT E. STRASZHEIM,
Associate Agricultural Statistician.

*Preliminary.

Figures from 1910 on have been revised by comparing index of livestock prices with index of prices paid by farmers for commodities bought. Previous to 1910 livestock price indices were compared with index of wholesale prices of all commodities.
