INDIANA 1941 CROP SEASON

From August 1940 to June 1941 the only months with more than normal precipitation were November and June. The accumulated deficiency of precipitation from the time of seed bed preparation for fall small grains to their harvest time was nearly 10 inches or 28 per cent of normal. As usual this sort of season in Indiana produced high yields of fall sown grains, 23.5 bushels for wheat and 15.5 bushels for rye. There was only nominal loss of seeded acreage. The harvested acreage of winter wheat was 1,470,000 out of the 1,483,000 seeded. Other utilizations than grain reduced the seeded rye acreage of 246,000 to 126,000 at harvest. The barley crop yielded 30 bushels per acre on 70,000 acres. The major portion of this is now winter or fall sown barley.

The subnormal precipitation did not seriously handicap ground preparation or the seeding of spring crops. There were localities where the moisture shortage reached drought proportions resulting in lowered yields of hay and the failure of new seedings of clover. The straw growth of oats was limited by rainfall but this crop benefited greatly from the good rains of June, and made a yield of 41 bushels per acre. The June weather delayed haying, hampered cultivation of corn, and planting of the later spring crops. It was favorable for setting tobacco, and newly set tomatoes and other transplanted crops. The shifting of haying toward grain harvest and the competitive need among cultivated crops for attention resulted in a rather sharp peak load of work at harvest time. After July 1st the moisture conditions were a source of constant apprehension of crop damage throughout the summer. The rainfall was of the showery sort and local drought damage resulted. The largest areas of such damage were centered around Johnson and Bartholomew counties, and Lagrange counties. In most other places crop damage from drought was mainly found in fields of lower fertility levels.

Corn harvest began at an unusually early date, but the heavy rains of October interrupted the work and delayed completion considerably.

The 1941 crop acreages were in the aggregate a little larger than last year. Corn was unchanged. Winter wheat and rye were slightly larger. Large increases were made in oats and barley acreage. Only small changes were made in most truck crops except for tomatoes and sweet corn which were sharply increased. Total tame hay acreage was lowered by the decreases in clover and timothy hay and soybean hay, although increases in alfalfa and lespedeza hay were very large. The soybean hay acreage was decreased because the favorable price of beans and changes in the adjustment program induced a large increase in soybeans for beans. The smaller clover and timothy acreage resulted from loss of seedings by drought in 1940.

Crop yields in 1941 were very good. While few records were broken there is only one past year better for wheat, one for rye, one for oats, one for corn and two for soybeans. Barley made a record yield. Tame hay made better than average yield, partly because of more acreage of alfalfa and higher yielding kinds. Fruit crops were good approaching a bumper size. Truck crops were varied but most yields were above average at least for the more important crops. Strawberries were cut short by local drought as were peas and cabbage. Grass seeds made just about average yields.

MINER M. JUSTIN, Sr. Agricultural Statistician;
ROBERT E. STRASZHEIM, Agricultural Statistician;
SIDNEY B. LEGG, Jr. Agricultural Statistician.

**TABLE I. SUMMARY OF THE ACREAGE AND PRODUCTION OF
INDIANA CROPS 1940-1941**

Name of Crop	Acreage Harvested		Yield per Acre		Production		Production Unit
	1940	1941	1940	1941	1940	1941

* The index of prices paid by farmers is reported by years from 1910 to 1922, inclusive, by quarters from March, 1923, to June, 1933, and monthly thereafter. The monthly figures used for the early years were obtained by interpolating between the quarterly or annual figures.

TABLE XII—RATIO OF POULTRY FEED TO THE PRICE OF POULTRY AND EGGS

Number of bushels of grain (three parts corn and one part wheat) that ten dozen eggs and 6.5 pounds of poultry would exchange for each month at Indiana farm prices. The ratio has been corrected for seasonal variation.

LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1941

In the year of 1940 the decrease in the numbers of horses and mules and chickens continued. A decrease in farm numbers of hogs and turkeys began, while numbers of milk cows, all cattle, and stock sheep made a further increase.

The number of horses January 1, 1941, was estimated at 345,000 head, which is a decrease of 22,000 head the past year. This is again the smallest number since 1867 and contrasts with the largest number of 854,000 in 1914, 1915, and 1916.

The estimated number of mules is 70,000 or 4,000 less than last year. The number of mules has not been so small since 1903.

The number of cattle of all ages is placed at 1,800,000, or 52,000 more than last year. This is the largest number of cattle since 1890 and in only two years since 1867 were there more cattle on Indiana farms. Favorable seasons for forage feed production, and reductions of grain acreage in conformity with the conservation program, have increased production of available feed best utilized by ruminant animals.

Milk cows numbers are estimated as 797,000 head, or 23,000 more than last year. This number has been exceeded previously only in 1934 and 1935.

Stock sheep number 721,000 or 21,000 more than last year. This is close to the average number for the past ten years. Sheep on feed January 1, numbered 180,000 or 10,000 less than last year, but an average feeding number.

The number of hogs dropped 7 per cent the last year and is now estimated as 3,896,000. This is about the same as in 1934 and was last exceeded prior to that in 1924. The low prices of hogs in relation to corn is believed responsible for the reduced numbers.

The 1940 pig crop in Indiana was estimated as 3,461,000 spring pigs and 2,776,000 fall pigs, making the yearly total 6,237,000. This is practically the same total as in 1939. The number of sows indicated for spring farrowing in 1941 is 498,000 or 87 per cent of the sows farrowing in the spring of 1940.

The number of chickens is 4 per cent less than January 1, 1940, or 15,637,000 head. Low prices last spring limited chicken raising. A decline of 10 per cent in turkey numbers to 140,000 birds is estimated.

Values per head are lower than a year ago for horses, mules, and hogs, but are higher for other species of livestock. Total inventory values are lower than last year for all species except cattle, sheep and chickens. The grand total of livestock inventory value declined 4 per cent.

The 1940 wool crop was 5,198,000 pounds from 693,000 fleeces weighing 7.5 pounds each. This is not much different from last year or from average.

UNITED STATES

Horses and mules continued the long decline, each species losing 2 per cent. Cattle numbers rose 4 per cent but milk cows only 2 per cent. Stock sheep increased 2 per cent to a record high number for over 50 years. Hog numbers declined 12 per cent partly because of exceptionally heavy slaughtering from October to December, 1940.

The number of chickens is lower by 4 per cent. The number of turkeys is down 18 per cent but the number of breeding birds is little changed. In 1940 there was an unusually large farm carry-over of market birds.

MINER M. JUSTIN,
Senior Agricultural Statistician.

ROBERT E. STRASZHEIM,
Agricultural Statistician.

TABLE I
Number of Livestock on Farms in Indiana

January 1	Horses	Mules	Milk Cows*	Milk Heifers†	All Cattle	Sheep	Swine
1927.....	540,000	101,000	680,000	116,000	1,295,000	731,000	2,961,000

* Preliminary.

Figures from 1910 on have been revised by comparing index of livestock prices with index of prices paid by farmers for commodities bought. Previous to 1910 livestock price indices were compared with index of wholesale prices of all commodities.

Before 1940, this series of data was published in the December issue of "Indiana Crops and Livestock."
