United States Crop Summary 1943-1944	28

THE 1944 CROP SEASON

From August 27, 1943 to October 27, 1944 the weather was definitely abnormal. Of the 61 weeks only 14 weeks had greater than normal precipitation, and 34 had normal or higher maximum temperature and 26 had minimum temperatures of normal and higher. The maximum reported temperature was 104 but only a few stations on a few days recorded temperatures of even 100. The minimum reported figure was -7.0 , but zero weather was of short duration, and many stations did not drop that low.

Winter wheat was sown with little more than enough moisture for germination. Moisture stayed below the point of leaching or of heaving from frost until winter temperatures were past. The rains in April perhaps were too heavy for optimum results for wheat, and there was more rain in May than needed. Temperatures were favorable throughout the season except for some rather warm weeks in May. Since these were not extreme, and did not result in the spread of rust infection a high yield was secured, exceeded only four times since 1866. Harvest weather was dry and favorable for quality and quick work.

Rye also had a favorable season, though the varied utilization made the yield less outstanding. Barley which is now mostly fall seeded made unusually high yields.

Corn planting was delayed by wet ground. The delay was not as pronounced as in 1943 since 25 percent was planted by June 1. Mechanized equipment enabled farmers to complete planting quickly when soil conditions became suitable. Dry weather in late June and July permitted cultivation even though wheat and hay harvest competed. Summer rains were showery and uneven. This resulted in local damage widely scattered. Chinch bug damage developed in some places. Heavy rains in late August and favorable temperatures enabled corn to outgrow early apprehensions, and with the advantage of hybrid seed, produced a yield above the long time average. Frost delayed later than average was an advantage in northern districts.

Oats seeding was delayed by heavy rains in March and April. The high proportion seeded late and poor stands of some of the early seeding resulted in lower than average yields.

Spring growing hays like clover and timothy benefited by the wet spring and made good yields. Alfalfa made a heavy first crop but drouth reduced yields of later crops and caused many fields to be left for seed. Lespedeza hay which was ready to make its growth just as drouth became severe was limited in acreage by short growth, which also reduced yields. Grain hay, largely oats, made light yields.

Pastures were exceptionally good in the early season, very poor in midsummer, but above average in the fall.

Tobacco made slow growth for considerable time after setting but recovered fully after the rains of August. Sweet potatoes followed the same pattern. Potatoes on non-commercial farms were planted under difficulties, many of them late, and produced a poor crop. Commercial growers who are mostly in three northern districts were also hampered by wet weather but were able to plant more seasonably than in other parts of the state. Because of the high proportion grown on muck soil drouth was less serious and the delayed frost permitted nearly normal growth. Yields were lowered by poor stands due to excess moisture at planting.

Mint crops were too wet early in the season but the summer drouth permitted almost complete recovery.

Tree fruits made fair crops in spite of some spring frost damage in April and on May 8th. Peaches had less winter damage than expected and little spring frost damage so the crop was above average, though reduced by summer drouth which prevented growth to large sizes. Apples had some frost damage in the spring and rainy weather hindered pollination and early spraying. Codling moth damage was greater than usual as the moth population was exceptionally large. Pears were similar to apples in making a somewhat better than average crop though not as large as usual when frost damage is absent. Drouth reduced the expected size of grapes and the production.

The season was favorable for alfalfa seed as the incidence of drouth came after the second cutting had started growth and continued until seed was mature in many fields.

The acreage of red and alsike clover seed was increased largely because of subsidy payments. Much second growth clover was used for pasture and the growth and yield

of seed on the acreage cut was limited by the dry weather. Lespedeza seed acreage was sharply increased because much acreage really intended for hay did not make enough growth to harvest for hay. The short vegetation could still be combined for seed and because of the subsidy made fair monetary returns even though the yield of seed was light.

Truck crops mostly made moderate yields. Late planting adversely affected peas, and drouth damaged sweet corn. Cantaloups were of fine quality but did not make bumper yields. Watermelons made additional growth after the August rains, and since the market would take even small melons they were picked closely, with resulting high yields. Tomatoes made an excellent finish of the growing season, lengthened by a late frost date and yields were above average.

Some crop yields per acre secured in 1944 with departures from the 1933-42 averages follow: Corn 38.0 bushels, down 1.2; wheat 20.0 bushels, up 3.0; oats 25.0 bushels, down 4.0; barley 24.0 bushels, up 2.2; rye 12.0 bushels, down .5; soybeans 16.5 bushels, down .3; tame hay 1.26 tons, up .01; alfalfa hay 1.60 tons, down .18; tobacco 1,123 pounds, up 237; potatoes 89 bushels, down 9.

LIVESTOCK SUMMARY—JANUARY 1, 1944

INDIANA

The numbers of cattle and hogs on farms January 1 are larger than a year ago while the numbers of horses, mules, and sheep are smaller. The number of chickens is also greater than a year ago but the number of turkeys is smaller.

The number of horses on farms January 1 is estimated to be 251,000 head which is eight percent less than a year ago. Horse numbers have declined steadily each year since 1915 when the number was 854,000, the largest in the state since 1867. The present value per head is \$88 which is the same as a year ago compared with a one percent decline in the index of prices received by farmers for all farm products sold.

The present number of mules on farms is 38,000 which is 11 percent less than a year ago. The number of mules is following a pattern similar to horse numbers with the peak number having been reached in 1916, and a general decline in number since that time. The January 1, 1944 value per head is \$108 which is one percent less than for the previous year.

There are 1,932,000 head of cattle on farms, representing four percent more than a year earlier. The number of milk cows increased two percent during the year while other cattle increased a little more than five percent. The present number of all cattle is larger than in any year since records were started in 1867. The value per head of all cattle on farms is estimated at \$77.30 compared with \$77.50 a year ago. The value of milk cows per head is \$105 which is two dollars more than a year ago. Judging by the January 1 number of milk cows on farms, most of the recent talk about liquidation of dairy herds has been unwarranted. It appears that dairy cows being slaughtered are largely cull cows and that good dairy cows have been added to other dairy herds in cases where liquidation of herds was necessary. It appears that we may have reached the turning point in the milk cow numbers cycle because the number of dairy heifers between one and two years of age is one percent less than a year ago, and the number of heifer calves being saved for milk cows is three percent less than a year ago.

There were 4,271,000 pigs saved in the spring of 1943 and 4,179,000 in the fall, making a total of 8,450,000 head for the year. This is by far the largest number of pigs saved in any year since 1930 when records began. If farmers' intentions for the spring of 1944 are carried out, the 1944 spring pig crop will be about 10 percent less than the 1943 spring crop. The large pig crops of last year resulted in 16 percent more hogs on farms January 1, 1944 than the preceding January. The value per head is estimated as \$16.60 or 25 percent less than a year earlier.

On January 1, 1944 there were 647,000 head of stock sheep on farms which is eight percent less than a year ago. There were 136,000 head of sheep and lambs on feed compared with 169,000 last year. The value per head of sheep is 14 percent less than a year ago. The 1943 lamb crop was estimated at 558,000 head which is one percent more than the year before. Wool production in 1943 amounted to 4,979,000 pounds compared with 5,490,000 pounds in 1942.

The number of hens and pullets of laying age on farms January 1, 1944 is 16,912,000 which is about four percent more than a year ago. There are 2,748,000 other chickens making a total of 19,660,000 for all chickens. The number of turkeys on farms January 1 decreased during the year from 77,000 a year ago to 63,000 this year; yet, in spite of the decreased number of breeders, producers are expecting to raise 15 percent more turkeys in 1944 than they raised last year.

Despite a record slaughter of meat animals in 1943, the number of livestock on farms increased again during the year and on January 1, 1944 was at an all-time peak. This increase in numbers was a continuation of the upward trend that has been uninterrupted since 1938. A sharp increase in hogs and a further increase in cattle more than offset decreases in horses, mules, and sheep. In terms of animal units that allow for differences in size and feed requirements of the five species, excluding poultry, the January 1, 1944 number was three percent larger than a year earlier and 15 percent above the 10-year (1933-42) average. In terms of grain consuming animal units the increase over a year ago was about seven percent, and in terms of hay and pasture units the increase was about 1.5 percent.

The total value of livestock on farms on January 1, 1944 was 8.8 billion dollars. This value was below the all-time high reached on January 1, 1943 by 1.5 percent. The values per head of all species except mules were lower than a year earlier and the increased numbers did not offset this drop in unit values.

The record number of livestock on farms followed the accumulation of record feed supplies during six years of abundant production, and has been encouraged during the past two years by the Government programs to increase the production of livestock products. In 1943 livestock numbers finally overtook feed supplies and much of this large accumulation of feed grains was used up. On January 1, 1943 feed grain supply per animal unit of livestock (including chickens) was the highest in 20 years. By January 1, 1944 this supply per animal unit had dropped 20 percent, to the smallest supply in seven years, and was 18 percent below the five-year (1938-42) average. The hay supply (1943 production plus carry-over) per hay consuming animal unit this season also was below the near record supply of a year earlier. Compared with last season the supply per unit was about five percent less, but was little changed from the five-year average.

Following the record pig crop of 1943 the number of hogs on farms January 1, 1944 advanced sharply to 83,756,000 head. The increase in number during 1943 was smaller than during 1942 and was also smaller than during 1939. Compared with a year earlier the number of sows and gilts for breeding was down, but both pigs under six months and other hogs over six months were up sharply. With all indications pointing to a sharp decrease in the 1944 spring pig crop, it is probable that hog slaughter in 1944 may be little greater than in 1943; but the total for the first nine months of 1944 will be materially greater than a year earlier.

A continuation of the upward swing of the cattle cycle during 1943 carried the January 1, 1944 numbers to a new record of 82,192,000 head or about four percent over the revised estimate of 79,114,000 head for a year earlier. All classes and ages of cattle were up, but the largest relative increases were in cattle kept mainly for beef. Milk cows were up two percent.

The number of all sheep on farms and ranches decreased about seven percent during 1943 and the January 1, 1944 number of 51,718,000 head was the smallest since 1940. Stock sheep decreased about three million head and sheep and lambs on feed about one million head.

The downward trend in the number of horses and of mules continued during 1943 with January 1, 1944 numbers of each down about four percent. There was a further decrease in the numbers of both horse and mule colts raised in 1943, which points to a continuation of the downward trend of work stock numbers for some years at least.

Numbers of both chickens and turkeys on farms made further increases during 1943 bringing chicken numbers on January 1, 1944 to a new record high and turkeys to the third highest.
