United States Crop Summary 1944-1945	27

THE 1945 CROP SEASON

Crop production in Indiana for all crops combined was very bountiful in 1945 in spite of weather interference with field work and other handicaps. This is the result of near record yields on one of the largest total crop acreages in history.

The fall of 1944 was dry, though there was enough moisture for germination of fall sown grains. The deficiency in precipitation for the last six months of 1944 was about six inches which suggested that a somewhat better than average wheat crop was in prospect as the fall sown grains entered the winter. The deficient precipitation continued through February, and temperatures remained below the growing point. Also snow covered the ground over most of the state from early in December 1944 to mid February 1945. This was favorable for fall sown grains. March brought temperatures averaging about ten degrees above normal and much moisture. Wheat started growth earlier than usual and grew rapidly. It seemed likely that the crop might yield more straw than grain. However from mid April till harvest temperatures were below normal every week except two, and precipitation was not greatly above normal. This slowed the growth of wheat, and the development of rust and other diseases. Wheat filled well and made an average yield of 22.0 bushels per acre, a figure exceeded only in 1931 and 1941.

Rye and winter barley followed the pattern of winter wheat in growth. Rye did not make a yield like wheat, because pasturing reduced grain yield on considerable acreage. The yield on harvested acreage was 12.5 bushels. Barley yielded 24.0 bushels per acre or six percent above average.

The warm weather of March made early sowing of oats possible. The cool wet spring induced continued sowing and some oats were sown much later than the usual time. The season proved favorable for oats as there were no extremely hot days and few times when the moisture in the ground was depleted. About 50 percent of the acreage was seeded with rust resistant varieties so rust damage was limited. The crop filled well and made 42 bushels per acre of good grain. In only 1940 was the yield higher.

The incidence of rains made timely planting of corn and soybeans difficult. Most of the acreage of these crops was planted by June 9 when heavy rains stopped such work for about ten days. Planting continued till after July 1. There was probably some shift to soybeans of acreage intended for corn. In the Southwest district of the state frequent rains and flooded ground increased the percentage of late planting, and seems to have prevented the planting of some intended acreage of both crops.

July and August were slightly cooler than average with precipitation very nearly normal. The lower temperatures lowered evaporation with the result that there was little time that plant roots could not use the soil completely to the surface for feeding. September had more than average rainfall, and in all but one week temperatures were above average. This resulted in rapid growth and more than made up for the delayed start of the season. October was favorable for maturing crops since moisture was slightly below normal and light frosts accompanying temperatures below average checked growth. Killing frosts did not arrive until nearly a week later than usual. The earlier planted corn developed large well filled ears. Late planted corn was not so well filled but little of it was so immature as to be subject to quick spoilage. However the moisture content seemed dangerously high until the warm dry weeks of October 29 to November 11. This period was very favorable for making corn ready for husking. The moisture content remained above average and this slowed husking so that when snow came early in December more corn than usual was still in the field. The yield of 53.0 bushels per acre was the second highest on record, only the 54.0 bushels of 1942 exceeding it.

The wet weather of September was not favorable for making soybean hay, but was favorable for the filling of pods. This may have been one reason for a smaller per-

centage than usual of the acreage being cut for hay. Also about 41 percent of the acreage was seeded in rows to lower seed requirements, and to make weed control possible. Solid seeded acreage was unusually weedy. Harvest was delayed in many fields until frost killed weeds. Improved varieties comprised two-thirds of the acreage. The yield of 19.5 bushels per acre is only five percent below the record yields.

The season was very favorable for the growth of grass since there was plentiful moisture and no searing hot weather. Pasture condition remained near record high levels throughout the summer. Hay yields were above average, though there was some loss, and considerable impairment of quality because of rains at harvest. First cutting alfalfa was especially affected adversely.

The cool summer resulted in exceptionally high yields of potatoes, even though some loss resulted from late September rains. The yield of 135 bushels per acre equaled that of 1942, the previous record. The higher proportion of the acreage on muck ground contributed to the record yield as well as the good growing weather.

Tobacco made above average yields though set late.

Clover and grass seeds made moderate yields. The incidence of rains favored growth more than seed setting, and hampered harvest.

Truck crops were rather variable. Beets, carrots, and peas found the cool season most favorable. Cantaloups and watermelons needed higher temperatures. Tomatoes were set late because of untimely rains and also suffered loss because of rains at harvest time.

Spring frosts damaged strawberries greatly. Early frosts also hurt apples and pears and grapes extensively. Peaches escaped much of the damage because of their concentration in the Southwest district.

LIVESTOCK SUMMARY—JANUARY 1, 1945

INDIANA

The numbers of all species of domestic animals on Indiana farms are smaller than a year ago. The decreases are greatest for hogs and sheep. Milk cows increased but beef animals decreased. Horses and mules decreased more rapidly than in recent years. The number of chickens decreased sharply but turkeys increased very sharply.

The number of horses on farms is now estimated as 231,000 which is eight per cent less than last year. The colt crop is too small to replace death losses, and some shipment of horses still occurs. The value per head January 1 at \$61.00 is \$27.00 below last year. This is the greatest and sharpest drop in horse values since records began in 1867.

The 34,000 mules estimated now is 11 per cent less than last year and about one-third the number on farms in 1916. The January 1 value of \$94.00 per head is down from \$108 in 1944.

The number of cattle at 1,893,000 is two percent lower than on January 1, 1944, when they reached the record number of 1,932,000. Cows and heifers for milk again increased by two percent to 832,000 head, but other cattle decreased five percent. The decrease is mostly calves and feeder steers. The value per head of cattle is estimated at \$75.60 where last year the value was \$77.30. The value of milk cows and heifers dropped to \$100 from \$105.

The number of hogs is 80 percent of last year or 4,258,000. The spring pig crop in 1944 was 3,885,000 or nine percent smaller than the previous year, and the fall pig crop was 3,255,000 or 22 percent smaller than the previous fall. The total of 7,140,000 pigs in 1944 was 16 percent smaller than the 1943 crop. Sows for farrowing in the spring of 1945 are estimated at 571,000 head or 94 percent of 1944. The value per head of all hogs was estimated at \$18.30 January 1, 1945 where the 1944 value was \$16.50.

Stock sheep on farms January 1, 1945 were 14 percent less than last year or 508,000. There were 136,000 sheep and lambs on feed this year and 170,000 last year. The 1944 lamb crop was 105 percent of the ewes one year old or over or 483,000 head. The current estimate of wool shorn in 1944 is 4,126,000 pounds. The value per head of sheep January 1 is \$9.80 for 1945 and \$10.10 for 1944.

The number of hens and pullets of laying age January 1, 1945 at 15,613,000 is about 10 percent smaller than a year earlier. There are 1,975,000 other chickens making a total of 17,588,000 all chickens, or 87 percent of last year. The number of turkeys on hand is 85,000 or 135 percent of last year.

UNITED STATES

Livestock numbers declined rather sharply during 1944 after having increased steadily from 1938 to 1943 and having reached an all time peak in 1944 for numbers at the beginning of the year. The numbers of all species of livestock and also of chickens and turkeys on January 1, 1945 were below those of a year earlier. Thus 1944 was one of the few years on record to show such a general tendency for numbers to decline. The most marked decreases were in the numbers of hogs, sheep, and chickens.

The total value of livestock on farms on January 1, 1945 of 8.2 billion dollars was down 7 percent from a year earlier and 8 percent from the all-time record high value of two years earlier. Not only were the numbers of all species below last year but the values per head for all except hogs were also down.

The general decline in livestock numbers in 1944 was caused very largely by the tight feed situation during the first half of the year and the generally less favorable

relationship of livestock prices to feed prices. As a result of this decrease in livestock numbers and of the record production of feed grain in 1944, the feed situation at the beginning of 1945 is much more favorable for livestock producers than it was a year ago. The supply of feed grain per animal unit of livestock (including chickens) on January 1, 1945 was 27 percent larger than a year earlier, and slightly above January 1, 1943. It was the highest in over 20 years, and was 7 percent above the 1939-43 average. On the other hand hay supplies (1944 production plus carry-over) per animal unit this season were below those of a year ago, as a result of the relatively small decline in hay consuming animals and smaller production and carryover of hay. Compared with last season, the supply of hay per unit was down one percent and was five percent below the five-year average.

Following the 29 percent decrease in the 1944 pig crop and a record slaughter of hogs in 1944, the number of hogs on farms on January 1, 1945—at 60,660,000 head—was down 28 percent from the all time record number of a year earlier. In numbers, this was the largest decrease for any year on record, but the percentage decrease was less than during the drought year of 1934.

The upward swing of the cattle number cycle was halted in 1944 and numbers declined nearly one percent. In view of the record slaughter of cattle and calves in 1944, this decrease in numbers seems relatively small, since it was generally expected that numbers would be considerably below the 81,760,000 now estimated. The present estimate reflects the lowest numbers indicated by a reasonable interpretation of the reports of livestock farmers.

The decline in sheep numbers that started in 1943, was continued during 1944 at an increasing rate. The total of all sheep and lambs, estimated at 47,945,000 head on January 1, 1945, was down seven percent from a year earlier. Since the estimated number of sheep and lambs on feed for market on January 1, 1945 was larger than a year earlier, all of the decrease is in stock sheep, which are at the lowest level since 1928.

The downward trend in the numbers of horses and mules continued during 1944. The numbers of both horse and mule colts under one year old made further declines in 1944, and the end of the long decline in work stock numbers is not yet in sight.

The number of chickens on farms dropped rather sharply during 1944 with the number on January 1, 1945 estimated at 511 million birds, down 11 percent from a year earlier but still 18 percent above the 10-year (1934-43) average. Turkey numbers, estimated at 7.5 million birds, were down about one percent, but the number of breeder hens was up.

Indiana Indices and Ratios Computed by Dept. of Agricultural Economics, Purdue University.

FARM PRODUCTION AND INCOME FROM MEAT ANIMALS

PRODUCTION—Quantity: The quantity of net production is the live weight actually produced in the State during the year. It is obtained by deducting the weight of animals shipped in from the weight of animals sold off of and slaughtered on farms and by adding or subtracting (as the case may be) changes in inventory weights between the beginning and end of the year.

INCOME: Cash Income is the total of receipts from sales of live animals by farmers and from sales of meat from animals slaughtered on farms. It does not include receipts from direct sales of livestock among farmers in the State. No deductions are made for the cost of animals shipped into the State and no allowance is made for changes in inventories.

GROSS INCOME is the sum of cash income and the value of home consumption.

COST OF SHIPMENTS: Under this heading is included the cost of livestock shipped into the State from livestock markets and from outside the State. The weight of such inshipments is evaluated at an estimated cost per pound based largely upon reported market prices of stocker and feeder animals. The cost of purchases by farmers from other farmers within the State is not included.
