United States Crop Summary 1946-1947	30

THE 1947 CROP SEASON

Crop yields in Indiana for 1947 were mostly above the ten year average, but more than half the crops had lower yields than in 1946. Fall sown grains made yields both higher than average and higher than last year. Spring seeded crops generally made lower yields than last year and most of them below average. Tree fruits were better than average. The condition of pasture was 9 points above average for the season.

The fall of 1946 was cool and dry, but following a rain at the close of wheat seeding, growing temperatures continued two weeks later than usual. Winter grains went into the winter in excellent condition. Temperatures in the spring of 1947 reached the growing point three weeks later than usual, and rainfall remained below normal till near April 1st. From then till harvest rains were frequent and moderately in excess of average. Winter wheat escaped serious disease infection, or insect infestation and made a yield of 23.0 bushels per acre, a figure exceeded only twice in the record. Other fall sown grains made above average yields.

From the first week of April till about May 10th each week had more than normal rainfall and the frequent rains left little time when field work was possible. As a result oats seeding was mostly a month late.

The late seeding is believed mainly responsible for the below average yield of oats at 30 bushels per acre.

After mid-May above normal rainfall prevented further preparation of ground or planting till about June 10th. Most of the land for corn was plowed and planted between June 10th and 25th. Planting continued as late as July 1st in some of the southern Indiana river bottoms. Development of the crop before August 1st was slow because temperatures remained much below average through June and July, with light frost in low spots of northern Indiana on July 21st. From August 1st to September 25th, temperatures above normal enabled the crop to hasten development. Rather heavy frosts during the last week of September frosted corn in about 15 northeastern Indiana counties. This cold spell was followed by an usually warm October which dried the frosted corn, and enabled most of that not frosted to complete maturation. Killing frost was not state wide until November 8th. The yield per acre this year was 43 bushels compared with 51 bushels last year, and the ten year average yield of 44 bushels.

Soybeans like corn were also seeded late. Apparently much of the ground which could not be seeded to oats was seeded to soybeans. The high temperatures of late summer enabled this crop to reach a fair degree of maturity before frost. The area most heavily frosted in September is not one where soybeans are heavily grown. The yield of 18.5 bushels is only one-half bushel lower than in 1946. The excess of 1.0 bushels in yield over the 10 year average probably is due to new varieties rather than the weather.

The wet spring was favorable for the growth of hay crops. Rains ruined some first cutting alfalfa, and some clover and timothy hay was not cut because the needed labor was used for other farm operations which had been delayed by wet weather.

The tree fruit crops were unusually good. There was some spotted loss from spring freezing in the north central part of the state and along the eastern side of the state. This was the fourth successive year of satisfactory peach production. Expressed as a percentage of full crop commercial apple production was 79, peaches 74, pears 64, and grapes 69.

Truck crops for processing mostly made better than average yields. Exceptions were tomatoes and cucumbers which were adversely affected by early summer drought in the northern part of the state, and then were cut off from late season growth by September frosts. The truck crops for fresh market were better than average except for cantaloups and strawberries. The cantaloups were damaged by too much rain and a heavy lice infestation. Strawberries suffered from heavy rains. Yields of mint crops for oil were well above average.

Tobacco again crowded the former record yield. Moisture was plentiful and the reduced allotted acreage was heavily fertilized.

Potatoes were adversely affected by the extremely wet weather in the spring on farm crops, and the summer drought damaged commercial planting not on muckland, in the northern part of the state. The result was a wide range of yields. The average was higher than the historical usual yield but below last year.

The fall of 1947 was favorable for fall sown grains which went into the winter with prospects for 1948 above average. The prolonged growing season for soybeans made harvest later than usual especially in weedy fields. The seeding of winter wheat after soybean harvest continued into November. The range of development of fall sown grain was therefore unusually great.

MINER M. JUSTIN NORMAN HORRALL ROBERT E. STRASZHEIM
Agricultural Statisticians.

LIVESTOCK SUMMARY JANUARY 1, 1947

Indiana

The numbers of horses, mules, milk cows, hogs, sheep and chickens on Indiana farms decreased in 1946. Total cattle numbers increased by one per cent.

The estimated number of horses is 168,000 which is 17 per cent smaller than a year ago. The yearly number of colts is about 3,000 so further decreases seem inevitable. Even greater percentage declines are possible in the next few years.

The number of mules is now estimated as 20,000 or 20 per cent less than last year. Yearly colt production of around 1,000 would nearly maintain numbers except for out of state sales.

The total number of cattle is 1,854,000 or one per cent more than last year. Cows and heifers two years old and over kept for milk decreased two per cent to 790,000. Yearling milk heifers also decreased, but heifer calves for milk stock increased. Among animals kept for beef the greatest increase was in cow numbers, some of which are in feed lots. Yearling heifers decreased but steers, and calves for beef production increased. Striking increases in inventory value occurred with value per head of all cattle rising to \$113.00 from \$84.20 last year. Prices per head of milk cows rose to \$152 from \$113 last year.

The number of stock sheep decreased seven per cent to 430,000. The estimate of number of sheep on feed is 165,000, a decrease of 16 per cent from last year. Decreases were found in all age classes of sheep. The value per head for stock sheep went to \$15.60 from \$11.20 last year, while the value per head of all sheep including feeding lambs rose to \$15.98 from \$11.14. The 1946 lamb crop was 368,000 or 111 per cent of the breeding ewes. Wool shorn in 1946 was 3,315,000 pounds from 448,000 fleeces.

The number of hogs is 4,115,000 or one percent below last year. The 1946 spring crop of pigs was 3,596,000 or seven percent larger than in 1945. The fall pig crop was 3,072,000 or six percent smaller than in 1945. Marketing was shifted somewhat from the usual pattern because of the sharp price changes which accompanied the changes in price controls and their final discard. The value per head rose to \$33.40 from \$22.10 a year ago.

Decrease in the number of pullets by three percent to 12,304,000 was partly offset by an increase in the number of hens by 207,000 to a total of 3,665,000. Total hens and pullets at 15,969,000 are one percent below last year. Other chickens are fewer than last year by 35 percent and number 2,179,000. The value per head of all chickens rose to \$1.35 from \$1.16 last year.

The number of turkeys remained unchanged at 110,000. However the value per head rose to \$6.40 from \$5.70.

UNITED STATES

The number of livestock on farms declined during 1946 for the third successive year since numbers reached an all-time peak on January 1, 1944. The decline during 1946 was greater than that in 1945 but was somewhat less than

the decline in 1944. For one of the few times on record, numbers of each species of livestock and of chickens and turkeys were lower at the end of the year than at the beginning.

In terms of animal units which allow for differences in size and feed requirements of the several species, livestock (excluding poultry) numbers on January 1, 1947 were about 3.7 percent below a year earlier and about 12 percent below the record high numbers of January 1, 1944. In terms of feed-grain consuming units, numbers were down 5 percent; including chickens they were down 5.9 percent. In terms of roughage and pasture units, the total was down 3 percent.

The numbers carried in this report are based upon revised estimates of livestock and poultry on farms January 1, 1945. These revised estimates for 1945 were derived from an analysis of the 1945 Census of Agriculture enumeration of livestock and poultry on farms together with other available data.

Despite the smaller numbers of all species of livestock the farm inventory value of livestock on January 1, 1947 of 11,252 million dollars was 25 percent larger than a year earlier and was the highest for all years. The values per head of cattle, hogs, and sheep, and of chickens and turkeys on January 1, 1947 reached record heights. The value per head of horses and mules were somewhat higher than a year earlier.

Supplies of feed grains on farms on January 1, 1947 were 10 percent larger than on January 1, 1946 and with the exception of 1942 were the largest January stocks on record. With livestock numbers down the supply of feed grains in relation to livestock was much more favorable at the beginning of this year than a year ago. The supply per unit of livestock was at record levels, being 17 percent larger than on January 1, 1946 and 8 percent above January 1, 1942, the previous high record.

The declines in numbers of horses and mules during 1946 were relatively, and in actual numbers, the greatest for any year on record. These declines were a continuation of the downward trend in evidence for many years, accelerated in 1946 by large exports of horses, a fairly large slaughter, and by a sharp drop in the crop of both horse and mule colts to the lowest levels on record.

The moderate decline in cattle numbers apparently is a continuation of the downward movement of the cattle numbers cycle. If this downward phase follows the pattern of most other cattle cycles, it will continue 4 to 7 years longer. It differs from other downward movements, however, in that much of the decline has resulted from decreases in numbers of milk animals. About half of the drop in cattle numbers in 1946 was in milk cows and yearling heifers being kept for milk cows.

The liquidation of sheep numbers, both in range and farm flocks, continued during 1946 and all sheep numbers are now at the lowest level since 1925. Stock sheep numbers are below the level reached following World War I and are the smallest on record going back to 1867. The number of sheep and lambs on feed on January 1 this year, however, was only about 11 percent below the average of the 1941-45 period and was abnormally large in relation to stock sheep numbers. Much of the decline in sheep numbers since 1943 has been a result of a marked decrease in the number of farms keeping sheep.

Hog numbers declined about 7 percent to the lowest level since 1941. Much of the decline was a result of the decrease in the 1946 fall pig crop. The number

of brood sows and gilts was larger than a year earlier but the number of other hogs over 6 months old was somewhat smaller.

A drop of about 10 per cent from a year earlier carried chicken numbers to the lowest point since 1941. The number of turkeys made a sharp drop of 22 percent from the near-peak number of January 1, 1946 to a level about 8 percent below the 1941-45 average but still 10 percent above the 1935-39 average.
