Wheat—Average Price per Bushel Received by Farmers, Indiana, 1908-1956	73

Introduction

Crop and livestock reporting is a service rendered to farmers and others in our state by the U. S. Department of Agriculture in cooperation with the Agricultural Experiment Station of Purdue University. There is a similar office in each state. The collection and dissemination of agricultural statistics is the oldest activity of the U. S. Department of Agriculture, having had its start in 1862 during the Civil War. Recognizing the many advantages of a joint relationship between the State and Federal governments in the development of agricultural statistics, Purdue University entered into a cooperative agreement with the U. S. Department of Agriculture to provide detailed agricultural statistics by counties, which are so vital to the economy of our state.

The basic information for agricultural statistics comes from thousands of volunteer crop, livestock and price reporters—farmers and others—who serve without pay. In addition, the township assessors at the time of personal property assessment enumerate crop acreages and other information which are so essential to reliable and timely agricultural statistics.

The Annual Crop Summary brings together, in summary form, most of the series of agricultural statistics pertaining to crops compiled and released by the Indiana Crop and Livestock Reporting Service. This particular issue is designed to serve as a historical reference carrying complete series of data from the time estimates were first made for particular items. Through passage of

Crop Reporting Districts

time, definitions of series of data sometimes change. These changes have been incorporated in footnotes so far as possible.

The Value of Agricultural Statistics

Crop and livestock reports are the basis for all outlook statements pertaining to agriculture. They let railroads know how many cars to have available in given areas to move agricultural production. They let container manufacturers know how much material to have on hand for container production. They are an aid to banks and other lending agencies in extending credit. They narrow the margin that dealers must take to play safe in their operation. They are an aid in the location of processing plants. They are basic in all governmental programs.

A man's judgment is no better than the facts at hand upon which to base his judgment. Agricultural statistics provide these facts pertaining to agriculture. Agricultural statistics are an aid to farmers in planning their operations. They make it possible for farmers to know what the situation is in the state and nation as a whole as well as in their own community. Since crop and livestock reports are available to farmers and others at the same time, farmers are on a par with every other group so far as access to information is concerned.

List of Available Reports

The Indiana Crop and Livestock Reporting Service publishes official estimates of crop and livestock production, prices received and paid by farmers, and various other special reports. A list of the more important reports and

the approximate date of release is shown in the table below. These reports are free and may be obtained by writing to Agricultural Statistician, Purdue University Agricultural Experiment Station Annex, Lafayette, Indiana.

Name of Report	Frequency of Report	Approximate Date Available
I. Crop Reports		
1. Intentions to Plant	Annual	March 20
2. General Crop Report	Monthly	12th of month
3. Annual Crop Summary	Annual	December 20
4. Grain Stocks		
a. On Farms	Quarterly	12th of month
b. Off Farms	Quarterly	25th of month
II. Livestock Reports		
1. Livestock on Farms, Jan. 1	Annual	Feb. 17
2. Cattle on Feed, Jan. 1	Quarterly	17th of month
3. Pig Crops, March 1	Quarterly	21st of month
4. Livestock Slaughter Report	Monthly	30th of month
III. Dairy Reports		
1. Cows Milked and Milk Production	Monthly	12th of month
IV. Poultry Reports		
1. Egg Production	Monthly	12th of month
2. Commercial Hatchery Report	Monthly	20th of month
3. Broiler Chick Placements	Weekly	Wednesday
V. Price Reports		
1. Prices Received by Farmers	Monthly	1st of month
2. Prices Paid by Farmers for Feed	Monthly	1st of month
3. Prices Paid by Farmers Other Items	Quarterly	1st of month
VI. Weather Crop Reports	Weekly Apr. 1-Oct. 1	Tuesday

The 1956 Crop Season in Indiana

The harvested acreage of all crops in Indiana in 1956 was 2 percent less than in the previous year. The reduced acreage is partly the result of extremely wet weather at planting time in a half-dozen northeastern Indiana counties, and in central Indiana in the area of both forks of the White River. In central Indiana considerable acreage was replanted while other flooded acreage in the area was not replanted, but instead much of such acreage was signed up in the Soil Bank Program.

Of the five major crops, wheat was the only crop with the same harvested acreage in 1956 as the year before. The acreage of corn was down 3 percent, oats down 4 percent, and hay down 6 percent, while the acreage of soybeans for beans was up nearly 7 percent to an all time high of 2,172,000 acres. The harvested acreages of barley and rye were also less than the year before.

The composite yield of all crops in Indiana in 1956 was 120 percent of the 1945-54 average despite some weather adversities. In the Indianapolis area farmers experienced difficulty in getting crops planted because of flooding. In numerous instances they were replanted two or three times but the late fall permitted late planted crops to reach full maturity. Lack of moisture threatened often during the growing season but crops were saved by timely showers. During the growing season there were no extended periods of high temperatures which are often damaging to crops growing under semi-droughty conditions.

The corn yield at 62.0 bushels per acre is five bushels above the previous high record set in 1948 and is 120 percent of the 1945-54 average. The wheat yield at 30.0 bushels is only a half bushel less than the record set in 1954 and is 130 percent of the average. The yield of

soybeans at 24.0 bushels per acre equaled the all time high set in 1954 and is 111 percent of average. The soybean yield was held down some by heat and drought near the end of the growing season. The yield of oats at 45.0 bushels per acre is the second highest of record, being exceeded only last year, and is 120 percent of average. The all hay yield of 1.76 tons per acre is an all time high and is 121 percent of average. The primary factor responsible for the record hay yield is the shift to a higher proportion of high yielding hays such as alfalfa. In 1956, alfalfa and alfalfa mixtures used for hay made up 53 percent of the total acreage. The tobacco yield per acre in 1956 was 1,750 pounds. This too is a record high and is 131 percent of average. The yield of rye at 20.0 bushels per acre is also a record high and is 139 percent of average. The yield of barley was 128 percent of average while popcorn was 113 percent.

There were 1,750,000 bushels of commercial apples produced in Indiana in 1956. This is more than twice the size

of last year's small crop and is 128 percent of average. The peach crop on the other hand, at 425,000 bushels was nearly five times the size of last year's small crop but only 89 percent of average. The small apple and peach crops of 1955 were due to a severe freeze in late March.

The fall of 1956, due to lack of precipitation, was very favorable for the completion of crop harvest, but rather unfavorable for the growth of fall sown grains. Most of the wheat was seeded in the dust and as a result was very slow germinating. The wheat came up with very spotted stands at first. Finally, after light showers, the stands are reasonably good, but much of the wheat made limited growth before winter. Indiana farmers seeded 1,211,000 acres which is the same as last year's acreage. Taking into account condition of the growing crop, weather, and changing varieties, the December 1 forecast of production is for 33,908,000 bushels or an average yield of 28.0 bushels per seeded acre.

¹ Prior to 1909 wild hay is excluded.

² Prior to 1909 prices are as of December 1. Prior to 1939 prices are on a loose hay basis, while from 1939 through 1954 prices are on a baled hay basis.

* Computed as follows: The index of Indiana Farm Prices (table 74) divided by the United States Index of Prices Paid by Farmers. Monthly ratios for 1937 and later years and all annual ratios 1910 to 1956 are the relationship of the Index of Indiana Farm Prices to the U. S. Index of Prices Paid by Farmers for Commodities, Interest, Taxes and Farm Wage Rates. Monthly ratios for January 1923 through December 1936 are the relationship of the Index of Indiana Farm Prices to the U. S. Index of Prices Paid by Farmers for Commodities, Interest and Taxes. Monthly ratios prior to January 1923 are the relationship of the Index of Indiana Farm Prices to the U. S. Index of Prices Paid by Farmers for Commodities only. Ratios computed by the Agricultural Economics Department, Purdue University.
