

INDIANA EQUINE - DEATHS

CAUSE OF EQUINE DEATHS, INDIANA 2001 OTHER CAUSES

One of the other conditions is Neurologic diseases. Neurologic disease is a general term for problems which affect the central nervous system. These can range from dummy foals, which is a result of circulatory dysfunction, to wobbler syndrome. Wobbler syndrome (equine spinal ataxia), is a result of improperly developed bones in the neck. These bones then cause damage to the spinal cord, resulting in the muscular incoordination that characterizes wobbles.

This Condition Caused 740 Deaths
17 Percent of the 4,400 Total Equine Deaths
