FOREWARD

New Mexico agriculture is faced with keeping in step with new requirements and needs of the consumer. In addition, allied industries must keep pace with changes in agriculture to meet its needs in order to adequately provide food and fiber to the people of this country and the world.

To assist all concerned, we take pride in presenting Volume VI of New Mexico Agricultural Statistics, bringing up to date agricultural production by counties and production values of the major crops of New Mexico.

This work is a cooperative program of the New Mexico Department of Agriculture and the Statistical Reporting Service of the United States Department of Agriculture.

Dallas Rierson
Dallas Rierson
Director

Annual Crop Summary

New Mexico farmers had a relatively good year as far as most crops were concerned. Some dryland crops suffered from the drouth in the early spring of 1966 which caused some acreage abandonment. Most weather stations reported near normal amounts of moisture received during 1966, but most of this moisture fell during the summer months which resulted in a rather dry spring. Although yields were generally higher, production decreased for most crops. Production was down on such crops as wheat, cotton, corn, barley, oats, alfalfa seed and broomcorn. For most crops this drop in production was a direct result of a decrease in acreage harvested. Other factors which resulted in a drop in production were poor dryland conditions in early spring, hail and flood damage in isolated areas, insect and disease damage and an early frost which prevented some crops from maturing out properly.

Wheat planted in the fall of 1965 got off to a good start and provided excellent pasture for livestock throughout the winter months. Very little moisture was received during spring, resulting in approximately 54,000 acres of dryland wheat being plowed under. Wheat production at 4,794,000 bushels fell 4 percent under the 4,924,000 bushels produced in 1965 and the slight decrease in production can be attributed to abandonment of dryland acreage.

Feed grain production increased by 17 per cent over 1965 due entirely to an increase in sorghum grain production. Corn, oats, and barley showed slight decreases in production whereas sorghum grain increased from 12,488,000 bushels in 1965 to 14,927,000 bushels in 1966; this represents a 20 percent increase. Excellent moisture conditions during planting time with an acreage increase accounts for this jump in production.

Cotton production fell 22 percent under the 1965 figure of 233,000 bales. This decrease in production is the result of a decrease in harvested acres, infestations of pink bollworm and other insects and an early frost which delayed maturation of cotton especially in the northern producing areas.

All hay production was the highest ever on record in spite of a 7,000 acre decrease in harvested acreage. Yield increased from 2.99 tons per acre in 1965 to 3.53 in 1966. Production increased by 122,000 tons and is currently at 933,000 tons. The primary reason for this increase in hay production is due to more irrigation water available and extremely good moisture conditions in dryland hay areas.

Broomcorn production fell 26 percent below last year's figure of 6,100 tons. An early freeze coupled with a 3,000 acreage decrease in harvested acres accounts for the decrease in production.

Some miscellaneous crops which had substantial increase in production were onions, lettuce, pecans and apples. Both onions and lettuce are becoming important crops in the Mesilla and Hatch Valleys as more acreage is devoted to these crops each year. Apples and pecans both shared in a rather large increase in production. Apples increased from 659,000 bushels in 1965 to 1,100,000 bushels in 1966 and pecans increased from 5.5 million pounds in 1965 to 7.0 million pounds in 1966. Excellent weather in the apple producing areas accounts for the apple production increase and bringing new orchards into production accounts for some of the increase in pecan production.

New Mexico Agricultural Statistics

New Mexico Agricultural Statistics

Livestock Summary

New Mexico livestock producers saw improved range conditions and livestock markets during 1966, although drouth had returned to the State by year's end. The good rains of 1965 resulted in a calf crop estimated at 645,000 head. Year-to-year price changes were virtually all on the upside with the exception of mohair.

Total cattle numbers rose about 2 percent during the year to total 1,333,000 on January 1, 1967. This is the highest cattle inventory estimate for New Mexico since 1945.

Cattle feeding in New Mexico continued to show the rapid growth which has accelerated for several years. The January 1, 1967 total cattle on feed was 140,000 head—an increase for the year of 28,000. Dairy and range cattle numbers held fairly constant during 1966.

Sheep numbers in New Mexico continued to drop to a year-ending inventory of 959,000 head. This is the lowest annual sheep inventory since estimates were begun in New Mexico in 1867. Sheep on feed January 1, 1967 were estimated at the same level as the prior year—52,000 head. Lamb and wool prices were both appreciably higher last year as compared to 1965.

Chicken numbers climbed 5 percent during 1966. The January 1, 1967 inventory is estimated at 899,000 birds. However hens and pullets of laying age were down 22,000 birds from the previous January 1. This indicates only a temporary lag in production because pullets not of laying age numbered 179,000—62,000 more pullets than were on hand the previous January 1. Egg production for 1966 at 153 million eggs rose nearly 6 percent. The average annual price of eggs at 44 cents per dozen was the best realized by New Mexico poultrymen since 1953.

More milk produced from fewer cows and selling at higher prices would seem to suggest a very prosperous year for New Mexico dairymen in 1966. However a considerable number of dairies in New Mexico went out of business due to higher transportation and other production costs. Milk cow numbers were estimated at 38,000 at the end of the year. Estimated 1966 production at 294 million pounds represents an increase of 2 million. Average annual production per cow rose to a record 7,740 pounds—a 250 pound annual increase.

Wool production held at the record low level of 8.7 million pounds, the same as 1965. However at 48 cents per pound, prices averaged 8 cents higher than 1965. State average fleece weights were estimated at 9.5 pounds for 1966.

Hog producers enjoyed another year of favorable prices. The low point of the year came in December when the all-hog average price fell to \$19.00/cwt. The 1966 annual average hog price should be well above the 1965 average of \$20.00/cwt. and considerably better than the \$15-16 prices which prevailed during the 1959-64 period.
