CROP PROGRESS AND CONDITION WEEK ENDING JULY 11, 2021

AGRICULTURAL SUMMARY: A second week of above average rainfall brought relief to the drought wrought state, resulting in notable improvements in pasture and range conditions in many parts of the state, according to the Mountain Regional Field Office of the National Agricultural Statistics Service, USDA. Although the additional moisture caused some delays in harvest, it provided a much-needed boost for growing crops. Reports from Dona Ana county noted a severe storm in the past week that brought slight wind damage with it. Pasture conditions are seeing an upturn according to reports from multiple counties, and livestock producers lessened or stopped supplemental feeding in Curry county as the week brought around 5-10+ inches of rainfall. San Juan rangeland and soil conditions are still on the dry side, but irrigation is going strong in parts of the county. Statewide, 53 percent of the State's pastures and rangelands were reported in very poor or poor condition, compared with 58 percent last year, and a 5-year average of 46 percent. During the past week, converted moisture totals ranged from more than 8 inches to merely a trace. Rainfall was fairly widespread, and heavier across the south and east, with total accumulations well above average in many locations. According to the United States Drought Monitor for June 29, drought-free conditions existed across an area equal to 3.6 percent of the State, up from last week's 1 percent. Abnormal dryness increased to cover 8.2 percent of the State. Moderate drought (D1) increased, and was present across 11.1 percent of New Mexico, while severe drought (D2) rose slightly to 27.8 percent. Small changes were evident in extreme (D3) and exceptional (D4) drought, with 23.7 and 25.7 percent of the State classified in the two categories, respectively. Collectively, about 59,979 square miles were still affected by extreme and exceptional drought. Topsoil moisture levels were reported as 54 percent short to very short, compared with 81 percent last year, and a 5-year average of 72 percent. Hail damage in all crops was reported as 1 percent light and 1 percent moderate. Wind damage in all crops was reported as 8 percent light and 4 percent moderate. Hay and roughage supplies were reported as 30 percent very short, 30 percent short, 39 percent adequate, and 1 percent surplus, compared with 3 percent very short, 38 percent short, 58 percent adequate, and 1 percent surplus last year. Stock water supplies were reported as 31 percent very short, 24 percent short, 42 percent adequate, and 3 percent surplus, compared with 21 percent very short, 51 percent short, and 28 percent adequate last year.
