## AGRICULTURAL Statistics

### 1980

SCOTT M. MATHESON  
GOVERNOR

STATE OF UTAH  
OFFICE OF THE GOVERNOR  
SALT LAKE CITY  
84114

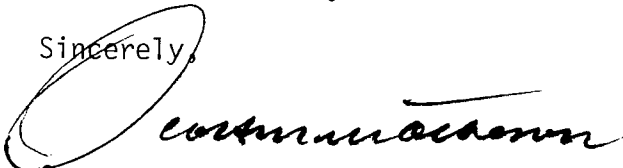

To the Citizens of Utah:

It is my pleasure to present the 1980 edition of the UTAH AGRICULTURAL STATISTICS to the citizens of the state of Utah. In cooperation with the USDA Economics, Statistics, and Cooperatives Services, the Utah Department of Agriculture publishes this report annually to provide accurate information to the public.

We are facing some very important decisions that will determine the future of agriculture and the very way of life of our state. Embodied in this publication are facts that will help form a basis for accurate decision making for continued growth in our state.

Once again I congratulate those responsible for the accumulation and publication of this very important information which is so vital to our state's economy.

Sincerely,

Governor

STATE OF UTAH

## DEPARTMENT OF AGRICULTURE

"To Those Who Have an Interest in Utah's Agricultural Economy"

Each year the Utah Department of Agriculture, in cooperation with the USDA Economics, Statistics, and Cooperatives Service, has the responsibility of making available to the people of the State of Utah current statistics on the state's agricultural industry. It is my privilege, as Commissioner of Agriculture, to present this annual report entitled, UTAH AGRICULTURAL STATISTICS 1980, for those interested in our agricultural economy.

In 1979, gross receipts of Utah's agriculture topped \$500 million for the first time. This makes agriculture one of the leading industries in the state. Contained in this publication is information on farm acreage, production patterns, weather data and crop budgets that will be helpful to many.

Every day our department receives requests for accurate information that may be used as a basis for very important decisions concerning the future of agriculture and our way of life. This publication is a result of those requests. Lately, we have been receiving an increasing number of requests for accurate county and regional data. There is a section of county estimates which attempts to fulfill these requests. We recognize that more complete accurate data is needed and hope that it will be attainable in the future.

We hope that the information contained herein will be informative and provide a greater understanding and appreciation of the state's agriculture.

Sincerely,

Dr. Kenneth B. Creer  
Commissioner

## UTAH AGRICULTURAL STATISTICS 1980

This report has been compiled and published as a cooperative effort and function of the following agencies of Federal and State Government.

### FEDERAL PARTICIPATION

U.S. DEPARTMENT OF AGRICULTURE – ECONOMICS, STATISTICS, AND COOPERATIVES SERVICE

Kenneth R. Farrell, Administrator  
William E. Kibler, Deputy Administrator, Statistics  
R. R. Hancock, Acting Director, State Statistical Division

UTAH CROP AND LIVESTOCK REPORTING SERVICE  
4432 Federal Building  
Salt Lake City, Utah 84147

Wilbur N. Sherman, Statistician in Charge  
Jack B. Goodwin, Assistant Statistician in Charge  
James E. Brewster, Agricultural Statistician  
Betty J. Owens, Supervisory Statistical Assistant  
Nancy Robinson, Typist

## I N T R O D U C T I O N

It may be hard to think of Utah as an agricultural state, with most of the population concentrated in a corridor along the Wasatch Front, but agriculture remains one of our most valuable industries. In 1979, for the first time ever, cash receipts from farming and ranching in the State exceeded the half-billion dollar mark. This is a far cry from what we see looking back over the decades. In 1930 the State had 508,000 residents and 27,000 farms with cash receipts of only \$52 million. By 1980 the population had increased by more than 2.5 times while the number of farms was only about one-half the 1930 level. Concentration of resources has been necessary over the years in order to keep the State's agriculture competitive. Along with the concentration comes mechanization and along with mechanization comes specialization. Most commercial producers today do one or two things and do them very well.

The outgrowth of all the change is an industry with a production efficiency unmatched anywhere in the world, but one that has become increasingly sensitive to cost-price changes. With increased fixed investments in land, machinery and other inputs and with cost constantly inching upward the farmer finds himself operating on very narrow profit margins. In years when prices fall and costs continue upward, the profits can quickly turn to losses. Unlike most other businesses, the farmer has no way of passing increased costs on to the consumer. The only way he has been able to weather the transition from 1930 to 1980 is by the almost unbelievable increase in productivity.

There will certainly be more changes ahead for agriculture, and we hope that the information supplied in this and similar publications will help make the transition a smooth one.

# Number of Farms

Since the depression of the 1930's, farm numbers have shown an almost steady decline--not only in Utah, but across the country. The trend has been to larger, more capital intensive farms with continually decreasing labor requirements. This growth in size of farms and increased mechanization has enabled the American farmer to take advantage of many production innovations. The result is an agriculture industry that is the envy of the world and an upward productivity spiral that can't be matched by any other segment of our economy. Corn is a striking example of this efficiency. Since the mid-1930's, when farm numbers were at a high, yield per acre for corn has increased fourfold. The result is that on one-fourth less acreage, we now produce three times as much corn.

For the most part, the reduction in the number of farms has been the result of consolidation of small farms into larger ones. Even though there has been much recent concern about the encroachment of urban development into farming areas, the actual percent loss of cropland has been less than 10 percent from the high in 1950 to the present. The problem of course is that while land in farms has been inching downward, world demand for food has been multiplying. Only by increased productivity have we been able to keep food on the table.

1/ 1850-1931 from U.S. Census of Agriculture--1940-79 are USDA estimates.

2/ Record high number of farms in Utah.

3/ The "Old Definition" of a farm included places of 10 or more acres that had annual sales of agricultural products of \$50 or more and places of less than 10 acres that had annual sales of \$250 or more.

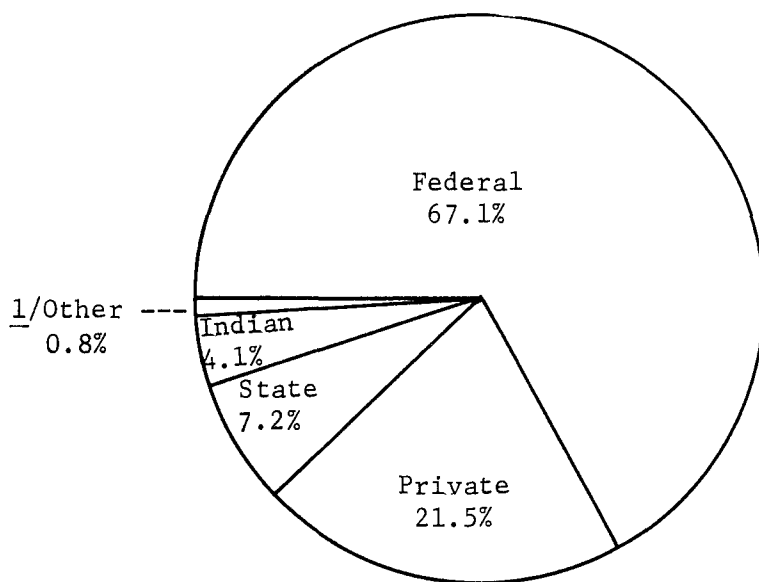

4/ The "New Definition" of a farm includes places which had annual sales of agricultural products of \$1,000 or more. This definition is also being used by the Department of Commerce, Bureau of the Census, for the 1978 Census of Agriculture.

5/ Preliminary.

# Land Inventory

Most of Utah's land area is used for agricultural purposes, however, the great majority is suitable only for grazing livestock. According to the Utah Conservation Needs Inventory Report, Soil Conservation Service, U.S. Department of Agriculture, October 1970, only 4.1 percent of the land area in Utah was cropland in 1967. Of this amount, nearly two-thirds was irrigated cropland. Counties in north central Utah had the highest proportion of their land area in cropland--varying from 10.6 percent in Utah and Box Elder Counties to 25.4 percent in Cache. In other sections of the State, every county had less than 10 percent of its land area in cropland and most had less than 4 percent with the lowest, 0.3 percent, in Grand.

Land in Utah is mostly under Federal ownership and control, which includes two-thirds of the State total, according to the above report. State owned lands amount to 7 percent of the total area and Indian lands are 4 percent of the total. Urban areas, roads, railroads, and small water areas account for less than 1 percent of the total. This leaves only about 21 percent of the State's total land area under private ownership (excluding cities and towns). In north central counties, private ownership as a percent of the total land area varies from 47 percent to 92 percent. In contrast, in south central and southeast counties, only 4 to 8 percent of the land area is under private ownership.

LAND AREA BY OWNERSHIP, UTAH 1967  
(Total exceeds 100% due to duplication in one county.)

1/ Urban, roads, railroads, and small water areas.

USE OF NON-FEDERAL LANDS AND ADMINISTRATION OF FEDERAL LANDS, UTAH, 1967.

1/ Other Federal includes Bureau of Reclamation and Bureau of Sport Fisheries and Wildlife.

# Farm Income

A farm income milestone was reached in 1979 as Utah farmers exceeded one-half billion dollars in cash receipts--up more than 11 percent from the previous year. Livestock and livestock products made the major contribution with a 12 percent increase in receipts. Livestock production has traditionally dominated the State's agriculture but in the last two years the role has become more dominant. In 1978 some 77 percent of all cash receipts were generated by the sale of livestock and their products. In 1979 the figure had risen to 78 percent. The strongest force behind the upturn in livestock importance has been the record high cattle prices. Cattle numbers began a steady decline in 1976 until a slight upturn was reported on January 1, 1980. The impact of the reduced numbers began to be felt early in 1978 when prices began to rise. By the end of the year, prices were at record high levels and the average for the year was a record high. The first quarter of 1979 brought more sharp increases before a leveling off came for the last three quarters. Another record high average was set in 1979--up \$17 to \$18 per hundred from the previous year. At the same time, cattle prices were at a record high; milk prices, lamb and wool prices, and turkey prices were also high. The result was a very strong year for Utah's livestock industry.

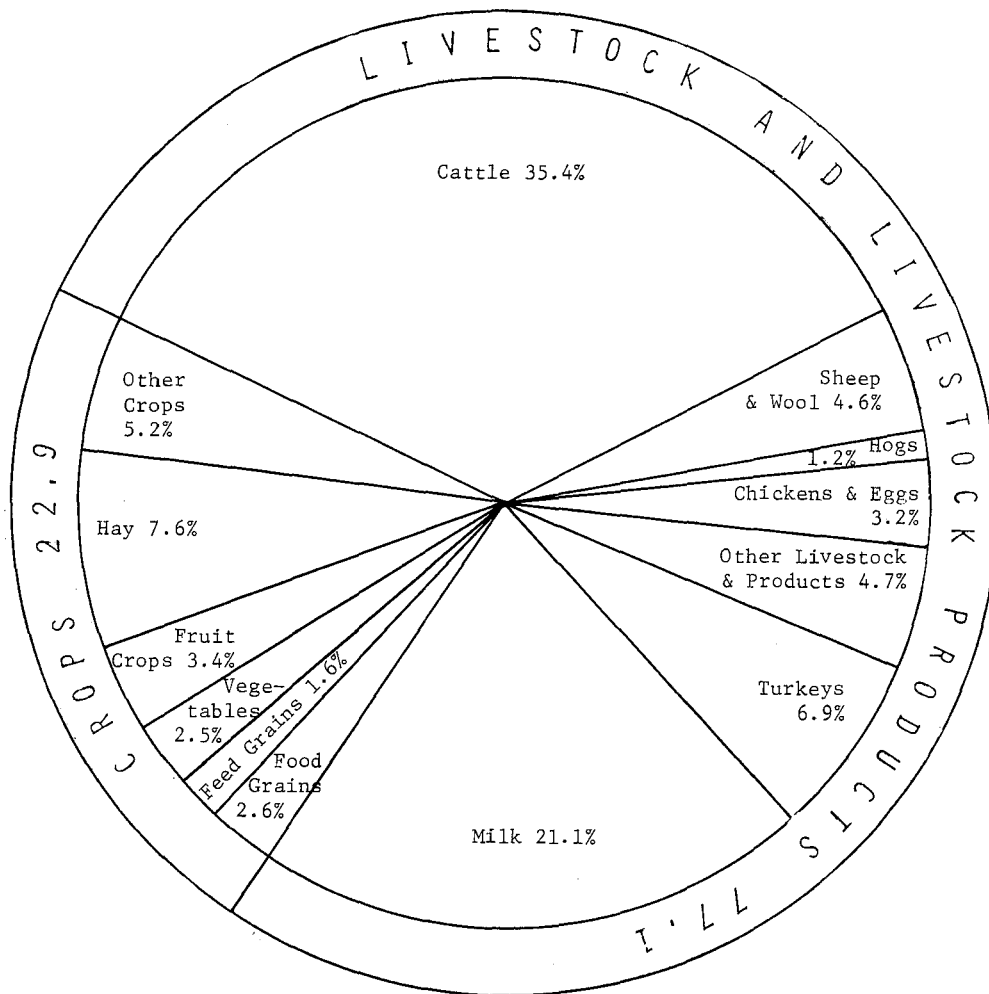

UTAH, NET FARM INCOME, 1968 - 1978

Crop producers also enjoyed a good year in 1979. The primary cash crops in the State are hay, wheat, fruit and vegetables. Hay production was at a record high and brought a near record price on the market. With strong demand and a good price, the 1979 hay crop helped boost the income to the State's farmers, and with roughly one-third of all crops cash receipts coming from the sale of hay, the contribution was significant. Wheat production was above the average of the past 5 years, and the price was the best since 1974. The 1979 fruit crop was one of the largest on record and with good prices, the crop was the most valuable the State has ever produced. Vegetables brought about the same income as 1978.

Looking back to 1978, the last year for which we have itemized data, there is a sharp 24 percent jump in cash receipts. Cattle again led the increase with an unequalled 70 percent increase in receipts. Poultry and eggs and dairy products also made substantial gains. Crop cash receipts in 1978 were unchanged from 1977 as gains in some categories were offset by losses in others. Wheat and fruits were down from the previous year while hay, barley, vegetables and other crops were up.

# Field & Seed Crops

Weather in the spring of 1979 was typical of Utah. Occasional periods of rain and snow and cool temperatures got planting off to a slow start. In Southern counties precipitation was well above normal. Fields in San Juan stayed wet so late into the season that growers had to switch from dry beans to wheat. In early May weather improved and allowed planting to catch up, but a light frost the second week set back progress again.

A storm around mid-June had brought some scattered frost and some hail damage to Davis, Weber and Box Elder Counties. The damage was mostly to fruit, but also affected field crops.

By late June hot dry weather had set in and was taking its toll of dry land crops and ranges. Fortunately, the winter snows assured an adequate supply of irrigation water.

The remainder of the summer was mostly dry and hot. Yield of dry land wheat was reduced below year-earlier levels as the hot weather accelerated ripening. Irrigated crops made reasonably good progress. Some concerns surfaced on the early tasseling of corn and the effects of the weather on the fruit crop. Corn, it turned out, yielded a respectable 94 bushels for grain and an excellent 19.5 tons for silage. The fruit crop did suffer some quality damage--size was reduced and apples did not color well.

Dry conditions continued into the late summer and fall. Much of the winter wheat was planted in conditions too dry for good germination. Harvesting weather however, was ideal as dry frost-free weather continued into October. Fall ranges were rated only fair-to-poor as livestock moved off the high mountain pastures, but hay supplies looked adequate for supplemental feeding.

Winter Wheat: A decline in winter wheat production in Utah during 1979 was noted in spite of an increase in acreage harvested. Production totaled 5,040,000 bushels--off 10 percent from the 5,626,000 bushels produced a year earlier. Acreage harvested totaled 210,000--an 8 percent increase from a year earlier. The average yield per acre this year, however, was 24.0 bushels compared with the 1978 average of 29.0 bushels per acre. Winter wheat seedings for the 1980 crop were indicated at 249,000 acres, an increase of 6 percent from the 235,000 acres planted a year earlier.

Spring Wheat: Production of spring planted wheat totaled 1,640,000 bushels during 1979, an increase of 57 percent from the previous season. Acreage harvested totaled 40,000 acres, an increase of 38 percent from the 29,000 acres harvested a year earlier. Much of the increase was in the Wasatch Front counties where the space was normally utilized with sugar beets on irrigated land. The average yield per acre of the 1979 crop was 41.0 bushels compared with 36.0 a year earlier.

Oats: Production of oats for grain totaled 708,000 bushels during 1979. This was an increase of 23 percent from last year's crop. Total acreage harvested at 12,000 was unchanged from a year earlier, but yield per acre increased from 48.0 bushels to 59.0 bushels.

Barley: Total barley production during 1979 totaled 9,039,000 bushels, an increase of 20 percent from a year earlier. Acreage harvested declined 3 percent, from 135,000 in 1978 to 131,000. Yield per acre, on the other hand, increased from an average of 56.0 bushels last year to 69.0 bushels for the current crop.

All Hay: Utah producers increased all hay production by 7 percent during 1979. This year's total tonnage equaled 2,026,000 tons compared with 1,886,000 tons produced a year earlier. Alfalfa hay accounted for 1,805,000 tons--an increase of 8 percent over the 1,669,000 tons produced in 1978. All other types of hay totaled 221,000 tons this year. The 1978 total was 217,000 tons.

Corn for Grain: Production of corn for grain totaled 1,504,000 bushels during the 1979 season. This compared with 1,440,000 bushels in the 1978 season--an increase of 4 percent. Average yields increased from 90.0 bushels per acre in 1978 to 94.0 bushels per acre in 1979. Acreage harvested remained unchanged.

Corn Silage: Increases in both acreage harvested and yield per acre combined to increase Utah corn silage production by nearly one-third. Acreage harvested in 1979 was 76,000 acres--up 7 percent from a year earlier. Average yield was 19.5 tons per acre compared with 16.0 tons in 1978. These factors combined made possible a crop of 1,482,000 tons of corn silage during the 1979 season. The 1978 crop was 1,136,000 tons.

Farmer prepares seedbed for spring planting.

Farmland is sectioned off to permit efficient irrigation.

Dry Edible Beans: Dry bean producers averaged 400 pounds per acre during 1979 to provide the best yield since 1975 when the yield was 420 pounds. Acreage harvested was limited to 8,000 acres because of difficulty in getting the crop planted in the spring. Excessive moisture kept the low lands too wet for land preparation. Total 1979 production was 32,000 hundredweight. A year earlier production was 24,000 hundredweight.

Potatoes: Production of fall potatoes totaled 1,300,000 hundredweight in Utah during 1979--15 percent more than the 1978 crop of 1,127,000 hundredweight. Acreage harvested, at 5,200 acres, was 13 percent more than a year earlier. Also, production per acre, at 250 hundredweight, was 5 hundredweight higher than last year.

Sugar Beets: Production of sugar beets declined drastically during 1979 because processing companies have closed down their plants in the State. Acreage harvested dwindled to 1,500 acres. A year earlier acreage totaled 12,600 acres. Production in 1979 was only 29,000 tons, the lowest on record. Yield per acre, at 19.4 tons, was the highest since 1972.

Some grain is stored in farm graineries.

Heavy equipment is often used to prepare soil for planting.

Wheat is loaded onto trucks for transport all over the nation.

# Fruits

The 1979 fruit crop was valued at \$22.3 million, 56 percent above the previous record set the year before. A very good production year (record output for peaches and tart cherries) and strong prices combined to produce the new record. The production season was rare in that all six fruits were at very high levels of production. Until recently, apples had been the high value fruit crop in the State, but for three of the last four years, tart cherries have topped the list. At \$7.4 million, tart cherries accounted for one-third of the value of all fruit. Apples were not far behind with 27 percent.

With the exception of tart cherries, which are nearly all processed, most of the State's fruit crop is marketed through fresh market channels. In the last few years, essentially all the peaches, pears and apricots were sold as fresh fruit. Looking at the 1973-77 average, about one-fourth of the apple crop has made its way into processed products such as juice, sauce, dessert fillings, etc. About the same percent (25) of the sweet cherry crop was processed as was the apple crop. Cherries are usually brined or frozen for use in desserts. Traditionally, much of the local sales have been through roadside stands, but recently a new innovation--pick-your-own operations--has begun to appear. The appeal of this way of marketing is that the consumer can have a good product at a lower price, and the producer can solve some of his labor problems.

1/ Record high apricot production. 2/ Completely frozen in the spring.  
3/ Small quantities processed are included in "fresh" to avoid disclosure of individual operations.

Farmer inspects young fruit for possible problems.

# Vegetables

Production of vegetables for processing made a modest comeback in spite of a slight reduction in acres harvested. Production tonnage was the highest since 1976 and value of production was the highest since 1975. Production of vegetables for processing is concentrated in Box Elder, Cache, Weber, and Davis Counties.

Onion production increased 15 percent in 1979 because of an increase in yield per acre. Total production in 1979 was 830,000 hundredweight compared with 720,000 in 1978 and it was the largest of record. Acreage harvested in 1979 totaled 2,000 acres, and was unchanged from a year earlier--only 400 less than the record in 1944. Yield per acre at 415 hundredweight compared with 360 hundredweight in 1978 and was the largest of record. Weather was generally favorable for growing and harvesting the 1979 crop. Prices averaged \$5.00 per hundredweight which compared with the 1978 crop average of \$9.00 and the record high \$9.09 for the 1975 crop. Total value of sales from the 1979 onion crop sales was \$3,445,000--only 66 percent of the record high of \$5,247,000 established a year earlier. Davis County accounted for about two-thirds of the 1979 onion acreage with Box Elder accounting for most of the balance. A few onions were grown in Weber, Salt Lake and Utah Counties.

<sup>1/</sup> Includes tomatoes, green peas, sweet corn, snap beans, green lima beans, table beets, cucumbers for pickles. <sup>2/</sup> Record high acreage harvested of vegetables for processing.

# Cattle

Livestock have long been the mainstay of Utah's agriculture. The relative scarcity of crop land and the relative abundance of range land left little alternative to concentration on livestock production. Even as far back as 40 years ago when cash receipts from farming were less than one-tenth of today's levels, sales of livestock and livestock products accounted for more than 70 percent of the total. This relative portion of agricultural marketings has fluctuated a few points over the decades, but in the last few years has inched upward so that in 1979 it stands at 78 percent.

The two primary contributors to this dominance have been milk sales and cattle sales, with cattle usually well in the lead. For the decade since 1970 an average of nearly 30 percent of all cash receipts has come from the sale of cattle. The chart pictures the percent of receipts coming from cattle year-by-year and the average price of steers and heifers for the same years. Generally, as prices rose and fell, so did the percent of receipts. The one exception was in 1973 which was the year of the first oil embargo and the so-called Russian grain deal. During that year, grain

UTAH CATTLE: PRICE VERSUS PERCENT OF ALL CASH RECEIPTS

stocks were very low and world demand was high, with the result that most grain prices doubled. Cattle prices also rose, but not at the rate of the grain crops. In terms of actual dollars, cattle receipts were up in 1973, but because grain prices had risen so sharply, the percent of cash receipts tipped from cattle toward crops.

The middle seventies saw large cattle numbers nationally and consequently lower prices. In 1978 when beef supplies tightened, the price shot up and continued high through all of 1979. With last year's prices averaging near \$70 per hundredweight, the percent of cash receipts coming from the sale of cattle may well reach a record 40 percent.

Range cattle collect at watering troughs to drink.

Large commercial feedlots fatten cattle for slaughter.

Vaccinating calves is a family project.

Cattle are inspected at daily feeding.

1/ Includes slaughter in Federally inspected plants and in other slaughter plants, but excludes animals slaughtered on farms. 2/ First year of record. 3/ Not printed to avoid disclosing individual operations.

# Sheep & Wool

The good news around the lambing sheds this year has been the relatively strong prices of both lambs and wool and the hint of an upturn in the number of sheep produced in the State. Not since 1959 has there been any reversal of the downward slide in sheep numbers which began in the depression years of the thirties. In fact, only four times since the record was established in 1931 has there been an increase in stock sheep numbers. During World War II and the Korean era there were slight upturns and more recently in 1959. The 1980 increase is a modest 4 percent, but is a positive sign for the State's sheep and wool industry and for the first time since 1977 pushes the State's sheep herd above one-half million. The reason for the upturn and the optimism is obvious. The 1978 wool price was the highest since the oil embargo year of 1973 and the 1979 price will average higher than any year since the Korean War years of the early 1950's.

Shearing sheep is a strenuous task.

Typical sheep operation.

As a nation, we have not been a world leader in sheep production. We have less than one-tenth the number of sheep inventory of either the Soviet Union or Australia and are even overshadowed by relatively small South Africa and the United Kingdom. To complicate matters, most of our sheep are thinly scattered over the ranges of the Western States. A number of factors combine to lessen our competitiveness in the world markets. Distance from markets, predator protection and predator losses, high labor costs, etc. all combine to drive up the cost of producing sheep in this country. Sheepmen realize that to keep in the race they will have to improve efficiency and find ways to overcome their problems.

In other farm enterprises, an early step toward greater efficiency has been the concentration of production on fewer but larger operations. This apparently has not happened in the Utah sheep industry. Even though more than two-thirds of the State's sheep are owned by the top 10 percent of producers, the trend over the years has been toward smaller rather than larger operations. In 1965 the average size flock was 321 head. By 1979 the number had fallen to 211 head. Whether the upturn of 1980 will continue into a long-term trend, only time will tell.

Sheep enjoy lush pastures.

Newly shorn sheep are ready for spring range.

1/ Includes slaughter under Federal inspection and other commercial slaughter, excludes farm slaughter. 2/ First year on record.

# Hogs

As a feed grain importer, Utah has never developed a very substantial hog producing capacity. For the past 10 years inventories have ranged between 40,000 and 50,000 depending on the market price. Most of the production has been centered around the populated areas along the Wasatch Front. Farms reporting hogs have been very stable for more than a decade.

In 1979, following a record year in 1978, prices fell 11 percent. With both production and prices down, cash receipts dipped by nearly 12 percent--the lowest since 1974. Over the two-year period beginning December 1, 1977, U.S. hog inventories had jumped 18 percent. Prices came down in response to the large supply of pork, but were kept from further decline by the short supply of beef. Per capita beef use dropped to 107 pounds--from the 120 pounds in 1978 and the record 129 pounds in 1976.

For 1980, USDA economists are forecasting prices in the \$30's the first half of the year and possibly into the \$40's the last half. It will depend a great deal on the overall economy and its effect on the demand for meat.

1/ Includes slaughter in Federally inspected plants and in other slaughter plants, but excludes animals slaughtered on farms. 2/ First year of record.

# Dairy

Cash receipts to Utah dairy farmers in 1979 were up 15 percent from the previous year to \$111,039,000. This resulted from a 13 percent increase in the average price of milk to \$11.90 per hundredweight and a production increase of 106 pounds per cow for the year. The production of 12,474 pounds of milk is a record high level. Milk production accounted for 28.0 percent of the cash receipts from livestock and livestock products and 21.8 percent of the total cash receipts. The milk-feed price ratio was generally favorable throughout the year. Utah is following the national trend of less cows producing more milk with a lower milkfat test.

Ice cream manufacturers produced a record amount of ice cream and sherbet in 1979; production of ice milk, on the other hand, was down.

Total whole milk cheese production increased in 1979 but was still below the 1976 record and slightly lower than 1974. Cheddar cheese production was off one percent in 1979 but other cheese set a record. Swiss cheese set an all time high for production being up 6 percent. The excellent reputation for quality has made Utah produced cheese very popular. Utah cheese has found a ready market in the major population centers on the West Coast.

1/ Essentially all hard frozen.

Dairy cattle feeding at manger.

# Chickens & Eggs

Utah egg producers saw eggs rise an average of 1.0 cent per dozen during 1979 to 45.0 cents while laying feed rose from \$151 per ton in January to \$172 per ton in July before settling to \$168 per ton in December. Cash receipts fell \$47 thousand to \$14.4 million in 1979 with 383 million eggs being sold, off 10 million from 1978. The average number of hens during the year dropped 20 thousand to 1,660 thousand and eggs per layer at 232 was 3 less than the year before. The number of birds lost and sold during the year were up 17 and 14 percent respectively, while the number raised was down 7 percent. The majority of the eggs are produced by the large producers headquartered in Salt Lake and Utah Counties.

# Turkeys

Gross income from the sale of turkeys in 1979 was the second highest on record. An increase from the previous year in numbers produced and a record high average weight more than offset the effect of the two-cent reduction in the price per pound received. In terms of cash receipts to Utah farmers, turkeys rank fourth in importance, behind cattle, milk and hay. Utah producers operate at some economic disadvantage to their Midwestern counterparts since much of the feed is shipped long distances and freight costs add to the costs of production. The industry has managed to stay competitive through close cooperation and careful control of costs.

In 1980, the picture for turkey growers looks much less bright than it has for the past two years. Cold storage holdings are running well above recent years and supplies of other meats, particularly pork, are plentiful. For the first four months of 1980, U.S. prices averaged 20 percent lower than the same period in 1979.

Young turkey poults.

# Mink

For the fourth consecutive year mink production in the State has increased. The 413,000 pelts produced in 1979 compares with 411,000 a year earlier, and is the second highest since the annual survey began in 1969. The number of ranches producing mink in the State declined steadily from 1969 to 1976, but with better prices, the trend has reversed. Since 1976 there has been a slow but steady increase in the number of producers--up 14 percent in three years. A further increase in pelt production is indicated by the 6 percent increase in the number of females bred to produce kits in the spring of 1980.

The U.S. average price in 1978 was \$39.30--up 39 percent from 1977. At this price, Utah pelts were worth \$16.2 million or 3.2 percent of all farm cash receipts.

Utah ranks third Nationally in mink production--exceeded only by Wisconsin and Minnesota. Several color classes are produced in the State with "Standard" the most important followed by "Pastel". These two classes account for about two-thirds of the State's total. Demi-Buff, Pearl, Violet Type, and Sapphire account for most of the balance with a few Pale Brown, Gunmetal, Platinum, Lavender-Hope, Pink, and White also produced.

Mink production in Utah is primarily in the north central counties of the State--from Cache on the north to Utah County on the south. The heaviest concentrations are in Salt Lake, Morgan and Summit Counties. A few producers are scattered out of the main area--in the Uinta Basin and in central Utah.

# Honey

Beekeepers received a record high \$1.29 million dollars for their 1979 honey production. Both yield per colony and total production were below 1977, but the record price of 58.5 cents per pound brought the value to a new high. Since 1973 prices have been above fifty cents, ranging from 50.3 to 58.5. Yield per colony has been much more variable since it depends on weather, condition of nectar plants, disease, and several other factors. Price and value of beeswax also set record highs grossing \$67,000 for the season.

Colony numbers for the past several years have remained fairly stable. The range since 1971 has been between 43,000 and 48,000. In the longer run, colonies are well short of the 78,000 in 1936 and honey production is less than one-half the record high. In addition to the long term decline, there has been a trend away from hobby beekeepers with a few colonies to more concentration in the hands of a few relatively large producers.

1/ Record high number of colonies of bees.

# Farm Labor

Two long established trends continued in Utah farm labor in 1979---numbers of workers were down and wages were up. Total farm workers were the lowest since 1972, a year when the fruit crop was almost totally destroyed by spring frost. Utah has followed the national trend away from labor intensive crops. Vegetable acreage has declined sharply and sugar beet acreage has all but disappeared in the State. Fruits have held their own, but ways are being found to reduce labor in that industry. Innovations, such as drip irrigation systems and shaker harvesting of tart cherries, have helped bring down labor needs. Haying, which once required a sizable crew, is now largely a one-man operation. Even livestock handling has, with the addition of good pens, squeeze chutes and tilt tables, become less of a labor user. Dairy operations, historically heavy labor users, are becoming larger and more efficient.

Wage rates increased in 1979 at about the national inflation rate, rising from \$2.75 per hour to \$3.32. While the State's wage rates are a few cents per hour below the national average, they are above the average of surrounding states. Rates in Idaho and Arizona are higher than Utah, while Nevada and Wyoming are well below. Colorado and Utah are at the same level. Average wage rates are influenced by the types of agriculture practiced in a state as well as the general economy of the State. Naturally, some types of farm labor require special skills and command a higher price than would a field worker or a herder. In California, for example, where farm operators compete with industry for workers and where a diverse agriculture requires many special skills, wages are generally high.

Farm worker unloads hay cubes.

# Agricultural Prices

The series of "prices received by farmers" as published by the Department of Agriculture relate generally to average prices farmers receive for their products sold at local markets, or at the point to which farmers deliver their products in their own conveyances, or in local conveyances which they hire for that purpose. Prices received by farmers are estimated to reflect sales of all classes and grades of the commodity being sold. The average-price concept is that of a price which, if multiplied by the total quantity of the commodity sold, would give the total amount received by all farmers for the commodity. The primary reason for this definition of price is to evaluate income from marketings of commodities and thus to develop estimates of income to agriculture.

Prices for most commodities relate to the mid-month level for sales about the 13th to the 17th when surveys are made. However, prices for a few commodities such as milk and wool relate to all sales during the month and starting in 1977 barley prices represent an average for sales during the entire month.

Monthly prices have been discontinued for several agricultural products produced in Utah because the State accounts for such a small portion of the U.S. total. Only a season average price is now estimated for these commodities which include wheat, corn, oats, dry beans, potatoes, alfalfa seed, hogs, chickens and eggs.

Large-scale farming requires specialized facilities.

# County Estimates

A major shortfall of our Agricultural Statistics program has been the lack of information at the county level. Federal funding is provided for state and national estimates, but for smaller geographic areas funds must come from sources within the state. Utah is about the only remaining state where some county estimates program is not provided.

Until now the only source of county figures has been the five-year Census of Agriculture. Naturally, the problem with the Census is its timeliness. The information is usually two years old before it is published and is seven years old before the next publication. If the Census happened to be taken in a particularly good or particularly bad year the levels may not be a good indication of inter-census years. The Census also fails to keep up with changes that are occurring in agriculture. Since the 1974 Census was taken we have passed through at least two hog cycles, a major cattle cycle, and sugarbeet acreage has dropped to nearly zero in the State.

For some time the Crop and Livestock Reporting Service has made county estimates of wheat, corn and barley for use in some special Federal programs. We have been reluctant to publish these data since they are based on very small samples and are not as reliable as we would like. However, since we have made the estimates available to an increasing number of people on a request basis, we felt it only fair to publish them for the use of everyone.

In the long run, we hope to improve the estimates we are now making and to expand our program to include livestock and other crops. The success or failure of our plans will depend largely on the support we can find within the State. If you think the program should be expanded and improved, write your state legislator, your farm organization, the State Department of Agriculture or the Crop and Livestock Reporting Service and let your feelings be known.

Inspectors sample grain for grade and protein.

# Weather

The year of 1979 got off to one of the coldest starts in recent history. Woodruff reported an extreme minimum of  $-43^{\circ}\text{F}$  on New Year's morning and the Ouray weather station followed with the same extreme minimum temperature the following morning. These were the coldest temperatures since January 1949. Most of the Uinta Basin were unusually cold during the month, averaging nearly 12 degrees below normal. The number of days recording sub-zero minimum temperatures was also unusually high in many areas of the State. Both Myton and Park City Meadows recorded below zero minimum temperatures on 26 out of the 31 days of the month. February continued the below normal temperature trend and as a result heating bills soared and stress to livestock became quite serious in many areas of Utah.

Spring began with near normal temperatures or slightly above in all areas of the state except the Uinta Basin. April and May followed about the same pattern but with a rising trend in the Uinta Basin which climbed to near normal conditions. These spring temperatures got most agricultural crops off to a good start, but local subfreezing temperatures during late May and the first part of June caused problems in some areas of the State.

June temperatures climbed to above normal by the end of the month, which again looked good for agricultural production. A gradual cooling trend developed during early July and persisted during the remainder of the summer season.

September showed a complete reversal of the cool weather pattern as temperatures climbed to much above normal. The quality of late season apples were hurt by the unusually warm fall temperatures. A gradual cooling trend followed during October and November as temperatures dropped to some of the coldest of record for that period of the year. December ended the year on a brighter note as temperatures climbed and averaged about  $1\frac{1}{2}$  degrees above normal for the month.

The precipitation pattern for 1979 was not very bright. Except for the Northern Mountain division, above normal accumulations were reported during the first three months of the year. April is normally one of the wetter months of the year, but dropped to well below normal. Less than average rainfall continued during most of the growing season, with the driest months being June and September. For the last three months of the year, precipitation improved somewhat, but remained below normal.

Accumulated moisture for the calendar year was especially critical in the North Central and Northern Mountain divisions of the State. Only seven years have been drier than 1979 in the North Central division and only 6 years have been drier in the Northern Mountains. The Southern and Eastern divisions of the State were in much better condition until late in the growing season.

In spite of drought conditions in the northern part of the State, there was adequate irrigation water to assure a relatively good production season.

---

E. Arlo Richardson and Kenneth G. Hubbard, State Department of Agriculture Climatologists.

Frost Free Period, Utah, 1979 and Normal (1931-60).

# Fruit Tree Survey

In 1979 a statewide fruit tree survey was conducted. The study updated data last collected in 1972 on the number, age, location and in some cases variety of trees cultivated in the State. The study produced evidence that some long established trends in Utah fruit production have continued. Fruit production is being concentrated in fewer and fewer hands and producing areas are shifting to make room for urban growth. Apple and tart cherry plantings have increased while other fruits have decreased--some dramatically.

In the years since 1972, while there has been a modest 10 percent reduction in the number of trees on commercial fruit farms (farms with 100+ trees of any variety), the number of commercial operations is down 41 percent. In 1972, 841 people had commercial farms by the 100 tree definition but by 1979 the number had fallen to 499. Of the 342 out-of-business farms, 222 were in Utah County. In Utah County, despite the loss of more than half of the fruit growers, tree numbers have only dropped 5 percent. Other counties where commercial farms have gone out-of-business were Box Elder, down 26 percent; Davis, down 50 percent; Salt Lake, down 67 percent and Weber, down 17 percent. All of these are areas where fruit production has come in conflict with urban growth. In Utah County, where 70 percent of the trees are located, there has been a gradual shift in production areas from Provo and Orem to the south end of the county.

As a part of the shift in location and the reduction in the number of people producing fruit commercially, there has also been a shift in type of fruit produced. Apples and tart cherries, because they are less susceptible to spring frost damage, are becoming the fruits of choice among commercial growers. Another plus for tart cherries is that harvest is mechanized and labor requirements are much less than for other fruits. Disease has played a role in reducing pear production and has left growers pessimistic about the future of the fruit in the State. For example, only 200 new pear trees were scheduled for planting in 1979 compared with over 43,000 tart cherry trees. Spring frost is the main enemy of apricots and sweet cherries, making their production economically uncertain. The result has been a sharp reduction in tree numbers since 1972--down 49 percent for sweet cherries and 63 percent for apricots. In spite of all the changes that have occurred in the fruit business, total production seems to be holding its own if not increasing over the past few years.

1/ Includes all crops held on farms and those crops stored off farms by farmers as security for CCC loans. 2/ Includes debt owed to institutional lenders and to noninstitutional or miscellaneous lenders. 3/ Non-recourse CCC loans secured by crops owned by farmers. These crops are included as assets in this balance sheet. 4/ Less than \$0.5 million.

# Horses

The horse industry is one of the important livestock industries in Utah. However, there is a limited amount of statistical data available on horses and no data have been accumulated since 1974.

At the request of horse owners, we are presenting some summary data taken from the 1974 survey showing an estimated 132,743 horses in the State and their importance to our economy. Utah County had the highest number with 19,713.

Most horse owners used their horses primarily for pleasure. Ranching was the second most popular use. As indicated by the following table, many horses were kept for more than one purpose.

Over \$45 million were spent on horses in 1974 with an average of \$342.21 per horse. Actual income was impossible to determine because such a large portion was used for either pleasure or ranching.

The nature of the horse industry makes it quite difficult to obtain accurate data without somewhat high expense. For this reason the statistics are not more current. It is hoped that in the future sufficient funding can be secured to obtain up-to-date figures.

Many people derive enjoyment from pleasure riding.

Number and Percent of Utah Horse Owners Engaged in Specified Activities.

Primary Use	Number
Pleasure.....	24,843
Ranch.....	14,764
Show.....	5,073
Race.....	2,970
Rodeo.....	2,820
Total	37,367

Percentages do not total 100 because many owners reported more than one use.

# Enterprise Budgets For Farm and Ranch Planning

The budgets presented in this section are representative of enterprise information which can be used by farm managers and others to better plan and evaluate alternative crop combinations and rotations. Use of information of this type will assist in the selection of the most profitable organization of production enterprises.

Average Receipts, Costs, and Net Returns per Acre, for Alfalfa Hay  
Production on Class II Irrigated Land, Utah, 1979.

Item	Rate	Times Over	Labor	Power and Machinery	Materials and Service	Total 1979
----- \$/acre -----						
<b>Receipts:</b>						
Alfalfa, 4.5/tons	\$ 55.00/ton					\$247.50
By products .25 AUM	\$8.00/AUM					<u>2.00</u>
<b>Total</b>						<u>\$249.50</u>
<b>Variable Costs:</b>						
Fertilizer, 35 lbs. P205	\$188.00/ton 45%				7.31	7.31
Fertilizing		1	.56	1.44		2.00
Corrugating	4 acres/hr.	1	1.15	1.85		3.00
Ditching			.30	.45		.75
Spraying	6 acres/hr. @ \$7.25/acre		.75	2.50	4.00	7.25
Irrigating	2 acres/hr.	4	9.00			9.00
Water & operating & maintenance					7.00	7.00
Swathing	4 acres/hr. @ \$7.50/acre	3	3.40	19.10		22.50
Baling	\$ 8.90/ton	3	5.05	23.00	12.00	40.05
Hauling	\$ 7.00/ton	3	12.00	19.50		31.50
Interest	12% var. cost 6 months					<u>7.79</u>
<b>Total</b>						<u>\$138.15</u>
<b>Fixed Costs:</b>						
Land taxes	\$ 75.00 assessed @ 70 mills					5.25
Other						9.50
Establishment Cost for Stand of Alfalfa Prorated over 5 years						<u>23.00</u>
<b>Total</b>						<u>\$ 37.75</u>
<b>Total Cost:</b>						\$175.90
<b>Net Return to Land &amp; Operator Management</b>						\$ 73.60

Jay C. Andersen, Lynn H. Davis, and Stuart H. Richards, Economics Department, Utah State University.

The budgets have been prepared using information that can be found in other tables in Utah Agricultural Statistics. Thus the budgets illustrate a use for the data as published. The budgets were prepared for class II irrigated land which represents the better land and water situations found in many Utah counties. If your farming area is best represented by some other land class, the budgets should be adjusted to fit your local conditions. Since prices fluctuate because of supply and demand conditions, adjustments may be necessary for price also.

Average Receipts, Costs, and Net Returns per Acre for Barley  
Production on Class IV Irrigated Land, Utah 1979.

Item	Rate	Times Over	Labor	Power and Machinery	Materials and Service	Total 1979
----- \$/acre -----						
Receipts:						
Barley, 80 bu.	\$ 2.40/bu.					\$192.00
By products						4.55
Total						<u>\$196.55</u>
Variable Costs:						
Fertilizer						
75 lbs. N	\$147.00/ton	34%			16.21	16.21
25 lbs. P205	\$188.00/ton	45%			5.22	5.22
Fertilizing			.56	1.44		2.00
Plowing	3 acres/hr.	1	1.50	10.50		12.00
Disking & harrowing	8 acres/hr.	1	.90	5.10		6.00
Planting	4 acres/hr.	1	1.12	3.38		4.50
Seed 100 lbs.	\$ 9.95/cwt.					9.95
Irrigating	1 acre/hr.	3	13.50			13.50
Water & operating & maintenance					7.00	7.00
Ditching		1	.30	.45		.75
Spraying	6 acres/hr.	1	.75	1.60	1.80	4.15
Combining	custom				20.00	20.00
Hauling	\$ .20/cwt.		1.68	6.00		7.68
Interest	12% var. cost 6 months					6.54
Total						<u>\$115.50</u>
Fixed Costs:						
Land taxes	\$ 75.00 assessed @ 70 mills					5.25
Other						9.50
Total						<u>\$ 14.75</u>
Total Cost:						\$130.25
Net Return to Land & Operator Management						\$ 66.30

Average Receipts, Costs, and Net Returns per Acre for Corn Silage  
Production on Class II Irrigated Land, Utah 1979.

Item	Rate	Times Over	Labor	Power and Machinery	Materials and Service	Total 1979
----- \$/acre -----						
Receipts:						
Corn Silage, 16 tons	\$18.25/ton					\$292.00
Variable Costs:						
Fertilizer						
155 lbs. N	\$147.00/ton	34%				33.51
45 lbs. P205	\$188.00/ton	45%				9.40
Fertilizing	8 acre/hr.	1	.56	1.44		2.00
Plowing	3 acres/hr.		1.50	10.50		12.00
Disking & harrowing	5 acres/hr.		.90	5.10		6.00
Planting	4 acres/hr.		1.13	4.12		5.25
Seed, 20 lbs.						12.40
Cultivating & furrowing	3 acres/hr.	2	3.00	5.00		8.00
Spraying	6 acres/hr.	1	.75	1.25	2.15	4.15
Ditching			.30	.45		.75
Irrigating	1 acre/hr.	6	27.00			27.00
Water, operating & maintenance						7.00
Chopping	20/ton/hr. \$ 1.75/ton	1	4.50	23.50		28.00
Hauling	\$ 1.50/ton		8.00	16.00		24.00
Packing	\$ 11.05/ton		5.60	11.20		16.80
Interest	12% var. cost 6 months					11.78
Total						<u>\$208.04</u>
Fixed Costs:						
Land taxes	\$ 75.00 assessed @ 70 mills					5.25
Other						9.50
Total Cost:						<u>\$ 14.75</u>
Net Return to Land & Operator Management						\$ 69.21

Other budgets are available for other land classes as well as other crop and live-stock enterprises. For information contact the Economics Department at Utah State University.

## WHY HAVE CROP AND LIVESTOCK REPORTS

\* \* \* \* \*

A man's judgment is no better than his facts and crop and livestock reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing which helps to provide an orderly market.

They give producers the same foresight to future price trends that organized dealers possess.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are the basis for analysis of agriculture and other business conditions.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They enable transportation companies to make a better distribution of cars, trucks, barges, etc. for moving farm products.

They aid farm organizations, schools and others in planning constructive programs.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They are essential in enacting wise legislation affecting Agriculture.

They provide an accurate, unbiased picture of Utah agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.
