1989 UTAH AGRICULTURAL STATISTICS

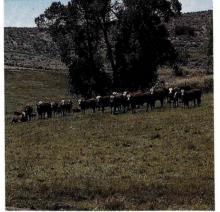

Utah Products

UTAH DEPARTMENT OF AGRICULTURE ANNUAL REPORT ENTERPRISE BUDGET

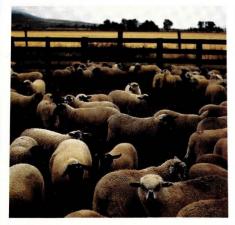

STATE OF UTAH office of the governor salt lake city 84114

Norman H. Bangerter governor

Dear Fellow Utahns:

Another year of progress has taken place in our state's great agricultural industry. I'm very pleased to have a hand in bringing you this report of the activities of our Utah Department of Agriculture for the 1988-89 fiscal year.

Espècially gratifying is the cooperation between state government and private industry, as well as with federal government agencies, in working out the needs of Utah farmers and ranchers. This team approach to solving our problems has a strength that can't be found in a single-unit attack.

Agricultural research is a prime example of this cooperation. Research projects funded by private money combined with tax funds have paved the way for improved crop varieties and livestock breeds, better pest control, and more food safety, among other goals. We also enjoy fine teamwork in improved irrigation techniques, natural resource conservation, the "Utah Works" program, Agriculture in the Classroom, and many more.

The enterprise budget section in the back of this report catches my eye. I hope our state's food producers will use this section to check the financial effectiveness of their own operations and to bring about improvements and a better family life.

In closing, let me express my personal gratitude for the diligence and patience of our state's 13,600 farm families who work to produce food for the rest of us, and to pay tribute to them for their productivity and perseverence.

Sincerely, Gangester

Norman H. Bangerter Governor

<u>I N T R O D U C T I O N</u>

Providing agricultural statistics and promoting the industry in Utah have long been the goals of the Utah Agricultural Statistics Service and the Utah Department of Agriculture. A strong cooperative effort between the two organizations continues to make this publication possible.

Farmers, ranchers, and agribusinesses in Utah continue to support these estimates by voluntarily sharing information about their individual operation. They are some of the best reporters in the Nation. The data provided are essential to quality estimates. A special thanks goes to them.

The Utah Department of Agriculture Annual Report helps keep you informed about the responsibilities of the department and what is going on. The agricultural statistics provide acreage, production, inventory, and price estimates of Utah's agriculture. Similar agricultural information about production in other States and the Nation can also be obtained from this office. The weather data show how last year was and how it compares with normal. Budget enterprises can be used for making decisions about what crops and livestock to include in your operation, or how your costs compare with others.

This is the nineteenth annual edition of the publication. Betty Owens has played a major role in compiling, typing, and editing since the first edition in 1971. She is retiring and this will be her last publication. A big "thank you" to her for her dedication and commitment to quality in preparing this publication for the past 19 years. We wish her the best in retirement.

State of Utah DEPARTMENT OF AGRICULTURE GOVERNOR'S CABINET

Norman H. Bangerter Governor Miles 'Cap' Ferry Commissioner

350 North Redwood Road Salt Lake City. Utah 84116 (801) 538-7100

Dear Friends of Utah Agriculture:

The term "feast or famine," which refers to our food supply, certainly applies to the farmers and ranchers who produce that food -- they have a "feast or famine" existence -- sometimes both in the same growing season. Across the nation, 1988 was a year of drought and crop disaster. But here in Utah, those farmers and ranchers who had enough water to get through the summer came out well, because prices were strong due to a shortage of production nationwide.

Net farm income was favorable again, in our state, following a good year in 1987. We're both building and planning more water storage for the state, which should help assure good crops in future years. Here in the West, we all love the beauty of our mountains, but we should also appreciate them for the water storage they provide -- a benefit that farmers in most other parts of the country don't enjoy.

Another thought about our mountains: due to their ruggedness, they are public property and are lost to normal crop production. Only about 3 percent of Iowa's land area is <u>not</u> in crops; only 3 percent of Utah's land area <u>is</u> planted to crops. If we are to realize any food-producing benefit from the nearly 80 percent of our state that is government-owned, it can only be through livestock grazing. That practice converts the inedible (to humans) mountain plants to good food for people.

There are many people, mostly non-Utahns, who feel that a lot of our mountain land should be in wilderness areas, without multiple use, including logging, livestock grazing, etc., permitted. The fact is that cattle and sheep help the feeding situation for deer, elk and other wildlife by keeping under control the growth of grasses that wild animals don't normally eat.

We hope this report will give you a feeling for the great contribution agriculture is making to the state's economy. With the production tools available today, less than 3 percent of the population can feed the whole nation, plus many people overseas. This means the rest of our workers are free to make the luxury items than mean such a good way of life for most Americans.

Sincere Ferry, Commissioner Cab Utah Department of Agriculture

Utah Department of Agriculture

MISSION STATEMENT

The department has a three-fold mission: To conserve and develop Utah's agricultural resources; to improve Utah's agriculture and allied industries financially; and to protect consumers, producers and processors.

The main goals of that three-part mission are in the following areas:

1. Development and Conservation

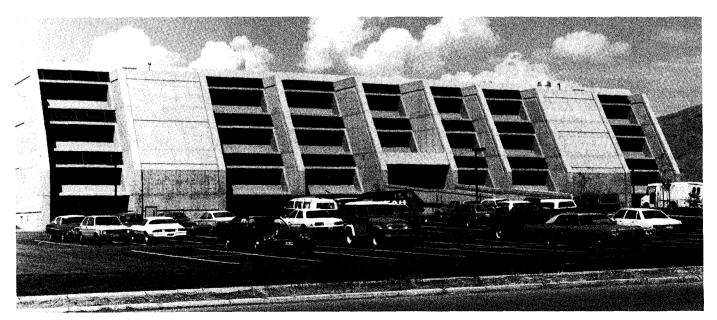

To protect, conserve and develop Utah's agricultural and natural resources, including water and land, among others.

2. Marketing and Promotion

To strengthen Utah's agriculture and allied industries financially by expanding present markets and developing new ones for Utah agricultural products; to help develop new products and production methods; and to promote instate processing of Utah agricultural products for a stronger state economy.

3. Regulation

To protect public health and safety as well as agricultural markets by assuring consumers of clean, safe, wholesome, and properly labeled and measured or weighed products. This includes products inspected by UDA's animal industry, plant industry, weights and measures, and food and dairy inspectors, plus other consumer products such as bedding, quilted clothing and upholstered furniture.

All the programs, planning and work of the Utah Department of Agriculture to improve Utah's farm and ranch economy and protect the state's buyers as well as sellers of farm products originate in this headquarters building in Salt Lake City.

Commissioner's Office

Despite a nationwide drought in 1988, the Utah agricultural economy made a continued recovery from the depressed situation of the mid-1980's. The Utah Department of Agriculture made great headway on its goals for the year.

Following are some of the goals spelled out in last year's annual report and the progress made on them:

* More sophisticated lab tests -- Purchase of new equipment has allowed new testing and faster results.

* Biotechnological research -- Work is being done on about a dozen agricultural research projects at USU.

* Increased "Utah Works" promotion -- The Department launched the second phase of this program designed to get Utahns to buy Utah products, with in-store promotions and use of the "Utah Works" logo in newspaper and television advertising by a number of cooperating stores.

* Publicity for department programs -- Increased numbers of news releases and other publicity gained fine media cooperation and resulted in broadly increased public awareness of the department and its programs.

* Increased resource conservation -- With the support of UDA, the Utah Soil Conservation Commission, and federal conservation programs, the state's 38 Soil Conservation Districts are making significant improvements to Utah's soil and water resources. More acres are receiving improvements than ever before.

* Loan mediation for producers -- The Department established a mediation program and hired a mediator with long experience in agriculture to help lenders and borrowers work our their problems. The program has already helped several producers.

* More push for farm and ranch profits -- Publication of enterprise budgets in this and earlier years' reports gives farmers and ranchers a way to get a handle on their costs.

* Still faster turn-around for seed and feed tests -- A target time of three weeks has been reached for all seeds but those that take more than three weeks to germinate. Feeds are also tested as soon as they come in.

* Mechanized grain-sampling facility in Ogden -- This remodeling project was completed and has operated successfully for several months. It has reduced the time required for grain truck drivers to get test certificates on their grain and has increased the safety of grain samplers during winter months, when trucks are icy.

* Cooperation with private industry in research, Ag in the Classroom, and other projects -- Private funding for joint projects such as a new agricultural exhibit at the state Capitol, a new teachers' handbook for the Ag in the Classroom program, and other projects attests to the close cooperation between the Department and private industry.

THE YEAR'S HIGHLIGHTS

Legislation

Among the bills passed by the Legislature in early 1989 of keen interest to the Department were the following:

* Assessed five cents per animal unit month (AUM) on state land grazing leases to control noxious weeds. Also created a noxious weed advisory committee in the Utah Department of Agriculture to advise the Commissioner. * Created a public rangeland mediation program (Section 8), to be administered by UDA. It provides a way for managers of public rangeland -- BLM and the Forest Service -and holders of grazing permits to work out differences on rangeland management, with a mediator'shelp.

* Appropriated \$3 million for a loan fund to go to farmers who suffered damage from the Quail Creek Dike failure in Washington county in January 1989. Money from the repayment of the loans will go to the Water Resources Construction Fund for water development projects.

* Authorized a committee to decide on future development of Utah Lake and granted the group powers to develop that facility.

* Established a task force to study use and sale of Bear River water.

* Added raccoons to the list of depredating animals controlled by the Animal Damage Control unit, a joint state (UDA) and federal program. A bill failed which would have established a fund to compensate farmers and ranchers for damage done by cougar and bear. However, the Division of Wildlife Resources agreed to control depredating animals to help prevent damage.

* Put further limits on open burning. In its original form, the bill would have limited agricultural burning activities, but those problems were amended out of the final bill.

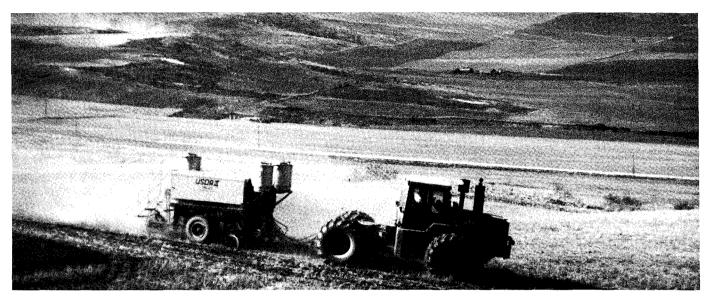

* Authorized agricultural cooperatives to hold telephone conference call board meetings, limit liability of officers and directors, and otherwise gain same protection as other corporations.

Research Support

The Department helped secure \$50,000 in an appropriation through Higher Education for the Biotechnology laboratory at Utah State University in Logan as well as committing \$50,000 of its own research budget to support other studies at USU. Research projects supported were:

* Irrigation Water Management -- Developed techniques to conserve water, energy and time by determining the exact crop water requirements and timing. This aided conservation on farms.

* Conservation Tillage -- Determined effectiveness of reduced tillage practices on different soils, crops, etc., for savings in time, equipment, fuel, soil compaction, water,

The goal of all UDA's research support is to improve the state's agriculture and the life of all her citizens.

and other production cost factors.

Calibration of Near Infra-Red Equipment -- This research has made it possible for farmers to get instant results from tests for protein, moisture content, and other factors in different kinds of hay, grain, and most other feeds.
Weather Network -- Remote control weather stations located in 20 main crop production areas give radio reports of weather conditions upon command from USU, permitting scientists to issue weather alerts to farmers when crops are in danger. (The U.S. Meteorology Service also uses these stations for state-wide weather reports.)
*Seed Certification -- Researchers developed standards

for about 20 new varieties of seeds, so crop producers can use those varieties with assurance that they are getting the quality they pay for.

* Enterprise Budgets -- This project funds the writing of the various enterprise budgets contained in the last pages of this annual report. It allows farmers and ranchers to compare their own production costs with those of other producers.

* Farm Safety Survey -- This research study determined how safe or hazardous farms and ranches are and produced a list of primary hazards.

* Erosion Plots -- Developed information on erosion rates for different types of land and crops and on off-site impacts, such as stream pollution. Erosion control techniques are demonstrated each year at a Conservation Field Day jointly sponsored by UDA and other agencies.

* Alternative Crops -- This research produced seeds of natives plants for use as crops for rangeland improvement. A growers' guide to seed production is now in print.

* Shrub Mortality -- After range specialists observed that there was a die-off of some feed and forage shrubs in the state, researchers checked into the reasons. They found a temporary imbalance in water, insects, etc.

* Embryo Transplants -- Scientists developed diseasefree embryos, which they implanted into ewes to avoid passing scrapie and other diseases on to the lambs.

* Ram Epididymitus -- No reliable test was available for

this serious disease until USU researchers developed such a test for the benefit of Utah's important sheep industry. * Role of Agriculture -- The impact of Utah's agricultural industry on the state's economy-- about \$8 billion in assets and sales -- was the subject of this USU research study. Animal Damage Control

Documented predator losses to Utah livestockmen in 1988 totaled \$3,213,000 just for sheep. Coyotes caused about two-thirds of those losses, with mountain lions, bears, and dogs next in number of kills. UDA's animal damage control unit worked to control losses by means of trapping and aerial and surface hunting. A total of 4,853 coyotes were killed in 1988 by government hunters, with fur trappers probably accounting for five times that many. Officials estimate the state's coyote population at 85,000.

Utah's cooperative program of state and federal control officers working together on the same staff is a model for the rest of the nation.

Ag in the Classroom (AITC)

This program promotes a better understanding of agriculture among Utah students in Kindergarten through sixth grade. (Some other states include secondary schools.) Two thousand copies of a 120-page teacher's handbook, "Utah Agriculture and Me," was printed during the summer of 1988 for distribution in classrooms during the 1988-89 school year.

Edith Bowen School on the USU campus in Logan -the official distribution center for new educational programs in the state, did in-service training with several hundred teachers, while county Farm Bureau women's committees and other groups also distributed copies to teachers. Most of the handbooks went to the schools free of charge, with the \$2.00 cost per copy paid to AITC by the sponsoring groups.

A revision is planned for the summer of 1989. Hopefully, sponsorship funds will be available to pay the costs of revising and printing enough copies for all 9,000 K-6 classrooms in the state this fall.

Administrative Services

Providing support services for the other six divisions of the Utah Department of Agriculture is the main function of the Administrative Services division. The following are the main areas of activity for this division:

* Budget: Administrative Services prepares the annual budget, based on division estimates, and provides accounting and computer services to provide a monthly report to each division director. This includes tracking 20 different programs for revenue and expenses.

* Personnel and payroll: This function includes keeping payroll and leave records on about 160 full-timeemployees and about 50 part-time employees, maintaining personnel and payroll records, helping with hiring new employees, keeping tax records, etc. During the report year, division personnel prepared and published a policies and procedures manual.

* Purchasing and other finance and accounting functions: Handling all aspects of purchasing of large equipment down through office supplies, making deposits, keeping all travel expense records, following proper bidding and purchasing procedures, and working with the Utah Department of Administrative Services. * Data processing: Doing maintenance and upgrading of computer equipment for all divisions, writing programs for such special applications as brand recording (with drawings), making back-up tapes of computer files several times a week, supervising computer training schedules for all department employees, etc.

* Licensing: Preparation of about 10,000 renewal licenses for bedding and upholstery manufacturers, nurserymen, beekeepers, buyers of agricultural products, livestock markets, milk haulers, food processing plants, and others.

* Contracts and administrative rule-making: Preparation of contracts for outside services -- advertising agencies, marketing organizations, and others. If changes are needed in our rules, the division ensures that the proper practice is used in filing them on time.

* Miscellaneous services: These include managing the UDA motor pool, operating the mail room, maintaining equipment inventory records, overseeing telephone services, purchasing and storing supplies, buying and supervising audio-visual aids equipment, handling risk management (self-insurance) records, doing leave accounting, providing petty cash, applying for and securing grants, etc.

Public Information

This past year saw an emphasis on news releases and other mass media coverage of agricultural affairs and department programs. The information officer coordinates news stories with radio, television and newspaper reporters, covers events and speeches for news releases, and handles media relations throughout the state.

A new destop publishing system (being used for this section of this year's annual report) resulted in the production of several publications, including a six-page flyer, "Facts and Figures on Utah Agriculture," which lists key statistics on county rankings, production figures, etc., for students and other interested citizens.

Other duties of the information officer include publishing a monthly employee newsletter; an external quarterly publication to political, business and farm leaders; special publications for specific audiences -- such as students, school teachers, and others; a monthly economic development report for state meetings; schedules of junior livestock shows in the state and related material; and other printed material.

Preparation of exhibits for educational conventions and workshops, for the State Capitol exibit area, and for special uses is part of the section's responsibility. So is preparation of audio-visuals and, occasionally, speechwriting.

Many queries come to the department about Utah agriculture -- from students in Utah and elsewhere, from advertising and public relations agencies, and other sources. This section is responsible for preparing material to answer such inquiries and to handle many of the replies.

The information officer represents UDA on a number of committees -- the state water education committee, the state Ag in the Classroom committee as chairman, the Utah Junior Livestock Show Association as secretarytreasurer, the public awareness committee of the Agriculture Advisory Council, and others.

Agricultural Development & Conservation

This division works in a variety of areas in helping the farmers and ranchers of Utah improve their operations, including but not limited to the following:

- * Soil conservation
- * Water quality
- * Agriculture resource development loans
- * Rural rehabilitation loans
- * Encouragement of new water development
- * Land and agricultural enterprise development
- * Increased production efficiency and profitability
- * Follow-up on agricultural research, especially at Utah State University
- * Farm energy program
- Liaison with the governor's agriculture advisory council

Soil Conservation

This section's main function is to work with the Utah Soil Conservation Commission, a state-wide group appointed by the governor, and with the state's 38 Soil Conservation Districts (SCD's). This provides UDA with one of its closest links with owners and managers of the private land in the state.

The name given to the 1985 national farm bill was the U.S. Food Security Act (FSA). It established a conservation reserve program and other programs to set marginal farmland aside, not to be used except in emergency (such as the 1988 and '89 droughts in the Midwest).

Utah's Soil Conservation Commission, the SCD's, and the Utah Department of Agriculture are helping to implement the FSA programs in addition to carrying out their regular activities.

After the 1985 farm bill was passed, Utah producers

agreed to put close to their allotted amount of land into the conservation reserve program. At the end of the report year, nearly 500 farmers had complied with the program requirements. The CRP land is to left in reserve for ten years, both to reduce soil erosion on marginal land and to keep hay and grain supply close to demand, thus avoiding the buildup of over-large reserves.

Water Quality

Non-point source pollution activities of the division has a broad influence on Utah agriculture, due to the reliance of Utah food and feed producers on irrigation water for most of their land. The pollution control work also affects Utah's cities, industries and recreation.

The program helps Utah landowners and operators manage their irrigation water and waste water systems to fall within federal and state pollution control standards. UDA has teamed up with the Utah Department of Health, U.S. Environmental Protection Agency (EPA), USDA agencies, and others to ensure that Utah's water supplies are of high quality.

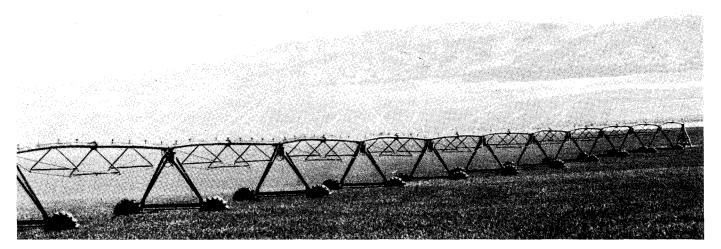

Twenty-one watersheds in Utah have been identified as high-priority areas for non-point source pollution control programs. Of these, six have their plans completed. They are: Little Bear River, Echo Creek, Muddy Creek, Montezuma Creek, Strawberry Reservoir, and the Jordan River.

The division has begun assessment of groundwater in the state to determine if there is pesticide contamination occurring and to prevent future contamination.

Agriculture Resource Development Loans (ARDL)

Helping Utah farmers, ranchers and food processors put new practices into effect is the purpose of this low-

Helping farmers and ranchers make improved use of irrigation water, along with working to develop more sources of water, is the purpose of several Utah Department of Agriculture programs to help both rural and urban Utah.

interest revolving loan fund managed by UDA.

Practices implemented in the past, with the help of the fund, include soil and water conservation techniques -such as installing irrigaion systems -- that improve overall farm efficiency. Loans made for rangeland improvement have helped increase the livestock carrying capacity by several times.

Other farm borrowers have improved wildlife habitat, built soil erosion control devices, and carried out other soil and water conservation activities.

Over the years, the Utah legislature has appropriated \$14.9 million to the ARDL fund. However, in the 13 years of its operation, \$21 million of projects have been put in place to enhance our soil and water resources.

A second loan officer added to the staff a year ago has been of crucial help in administering the increased workload of the ARDL program.

Rural Rehabilitation Program

This \$1.5 million revolving loan fund started out during the Depression days of the early 1930's as a federal program to help farmers hang onto their farms in those tough years. When the program ended, the federal government gave the funds to the states for use as seed money in helping young couples get started in farming and to help other farmers buy additional land or livestock to make their operations more financially effective.

The original \$300,000 has grown to its present size only through interest earnings, but the program has financed many projects in the agricultural sector of rural Utah.

Water Development

Plans to develop the water in the Bear River of northern Utah -- the last major source of undeveloped water in the state -- are slowly moving toward formation of a conservancy district in Cache county, Logan's location. A district is already functioning in Box Elder county, and a legislatively created Bear River Task Force is helping move planning and action along.

The Bear River flows through three states -- Wyoming, Idaho and Utah -- on its way to the Great Salt Lake, where more than 2 million acre feet of water flow into the lake every year. Under the plan now developed, up to seven reservoirs would store some of the water. Part of it would be used for irrigation, wildlife, municipal and industrial uses, and some could flow south to Salt Lake City or even farther.

Other water development projects, such as the Central Utah Project, also involve UDA effort.

Research Grants

The Agricultural Development and Conservation division administers research moneys appropriated for UDA to use in advancing the science of agriculture. The funds are granted to various applicants based on the potential use of their findings in solving the problems of plant and animal production in Utah. Such research has made many direct contributions to increasing Utah's agricultural revenues and cutting costs on farms and ranches. Although much of the UDA-sponsored research is done by the Agricultural Experiment Station at Utah State University in Logan, other studies have taken place on rangeland areas where shrub mortality was studied, certified seeds were developed, etc.

Farm Energy Program

With funds provided by a grant from the Utah Energy Office, division personnel carry out the following activities relating to farm energy:

* Conduct energy audits on farms to help improve energy conservation.

* Provide equipment to teach conservation tillage for energy and other savings.

* Develop irrigation water management practices that conserve energy.

* Carry out educational projects on energy conservation.

PROJECTS OKAYED FOR ARDL LOANS

Following is a partial list of projects for which approval has been given by the Utah Soil Conservation Commission as eligible for Agriculture Resource Development Loan applications. Interested parties can contact UDA's loan officers at 538-7176 in Salt Lake City.

- * Establishing or improving permanent vegetative cover
- * Irrigation water conservation
- * Sediment retention, erosion, or water control structure
- * Reduced-tillage or no-till system
- * Purchase of conservation equipment
- * Grazing land protection
- * Rangeland moisture conservation
- * On-farm water impoundment reservoirs
- * Spreader ditches or dikes
- * Diversions / terraces

- * Strip-cropping systems

Animal Industry

This division works in three important areas in supervising and enforcing state laws and programs affecting Utah livestock and poultry: animal health -- with special attention to animal diseases which can be transmitted to humans, animal identification -- brand registration and inspection, and meat inspection.

Because more than three-fourths of Utah's agricultural cash receipts come from livestock each year, the work of this division is critical to the state's economy.

ANIMAL HEALTH

The animal health section is involved in controlling and eradicating livestock and poultry diseases, supervising veterinary prescription drugs, improving animals' living conditions, checking the interstate movement of animals, upgrading the quality and wholesomeness of animal food products, and safeguarding the overall public health of Utah's citizens.

Scrapie

This very serious, slow, debilitating disease may take up to two or three years in the incubation period. Although the disease hasn't been present in Utah since 1957, it is so dangerous, and the sheep industry is so important to Utah's economy, that state officials are working with other agencies to eradicate scrapie everywhere.

The state veterinarian, who also serves as director of the Animal Industry division, spent three weeks in Australia in the spring of 1989 at a training course and tour concerned with this disease. World leaders on scrapie research were gathered there for the training and idea exchange.

Brucellosis

Utah livestock producers are fully supporting the rules for brucellosis control which were passed five years ago. The fact that Utah is a brucellosis-free state is important to the state's economy -- it means animals can be shipped in and out of the state freely.

Vaccination protects cows from abortion and also safeguards human health. In 1988, about 150,000 beef and dairy cattle were vaccinated in Utah as part of the brucellosis control campaign.

Other Diseases

Ram epidydimitus, a disease affecting sheep, is under research study at Utah State University for control possibilities. Sheep foot rot is also being studied there.

A swine disease called pseudorabies is a virus which does not transmit to humans but which can spread to cattle and other hogs. The division and the swine industry in Utah are working for total control; again, being declared a pseudorabies-free state will carry economic benefits in unrestricted interstate marketing.

Another serious problem is trichomoniasis in cattle. "Trich" is a veneral disease; a new vaccine is expected to yield good control, however.

Right at the end of the report year, a joint publication by UDA, Wildlife Resources and Public Health was distributed dealing with the control, importation, possession and transportation (CIPT) of all animals not considered livestock. This includes exotic birds, rodents, snakes, wild birds, fish and others. The implications to human health make this disease control work important to UDA and the citizens of Utah.

Embryo Transfer

In this technique being studied for possible scrapie eradication, a sheep embryo is transplanted from the donor ewe to a recipient. After the lamb is born, it must be observed for 60 months, because of the lengthy incubation period of the disease, to be sure it is really disease-free.

Researchers hope to find that the embryo is diseasefree when it is transferred and that a new generation of undiseased lambs can be use as foundation stock for clean herds. The embryo transfer technique is already being used to import superior genetics; as one researcher said, "A veterinarian can put a whole herd of superior animals in a suitcase and bring it to Utah."

Serology Laboratory

Hundreds of tests are run through this laboratory daily to analyze animal blood for brucellosis, leptospirosis, vibriosis, anaplasmosis, bluetongue, and equine infectious anemia. The facility is vital in the division's battle to control animal diseases.

Identifying and controlling these diseases has a great impact on safeguarding human health. The test results are applicable to humans and are correlated with the Utah public health system.

Other diseases under the careful scrutiny of the state veterinarian are tuberculosis in pheasants, pullorum in chickens and pheasants, and avian influenza in poultry. All three have caused problems in Utah in recent years. The division also monitors cattle for tuberculosis constantly because of the disease's possible effect on humans.

MEAT INSPECTION

Like the other food inspection services of UDA, the meat inspection section assures Utahns that only safe, inspected products are for sale in the state. Meat inspecA year ago, the state's meat inspection program performance plan was accepted by the federal government -which praised it as one of the best plans in the nation. It is saving thousands of travel dollars for Utah taxpayers through local training and certification of meat inspectors. All the people hired recently have been trained and have passed federal certification reviews in-state -- a process of four to five months.

Talmadge-Aiken Act

Inspectors working under this legislation are known as TA inspectors. Utah's state meat inspectors are crosslicensed as federal inspectors; because of that, provisions of the TA law allow certain packing plants in Utah to ship meat across state lines with state inspectors present in the plants. They do the federal inspection that interstate shipment requires.

Most Utah packing plants don't ship out of the state and only need state inspection.

ANIMAL IDENTIFICATION

This section handles the registration and inspection of brands, often encountering livestock theft being attempted. A total of nearly 30,000 brands -- 2,810 of them new -- were under registration at the end of the report year.

Ten full-time and about 45 part-time brand inspectors located all over Utah check brands at livestock auctions,

ports of entry, roadblocks and elsewhere. Utah law requires that all livestock owners moving or showing their animals have proof of ownership with them; brand inspectors look at this paperwork to protect owners from theft.

As livestock thieves are finding out, UDA's enforcement of brand inspection laws is effective -- thefts are being detected and solved quickly, with close cooperation between inspectors and county and local law enforcement officers. Stiff fines and jail sentences have been handed down in a number of cases during the report year.

In one recent case, cattle stolen in 1987 were sold at the Spanish Fork auction at that time. But careful note-taking and patient investigation by the brand inspector and county sheriff led to a conviction, a one-year jail sentence, and a \$15,000 fine two years later. In that case, the thief, under questioning at the auction, produced two bills of sale. Later investigation showed they were invalid, however.

Inspectors were able to return 918 cattle, 204 horses, and 650 sheep to their rightful owners during the year. Many of them strays, the animals' total value was \$697,868.

Inspectors checked about 648,000 head of cattle and 13,095 horses last year as the animals were being sold, transported, exhibited or slaughtered.

Through good cross-utilization between the animal health section and animal identification, brand inspectors are watching for signs of health problems in livestock and reporting them to the state veterinarian.

Checkoff funds for beef marketing and research totaling \$568,747 were collected by inspectors last year.

Controlling several serious diseases of sheep is essential to that important sector of the Utah agricultural economy. Because about 70 percent of the state's land area is government-owned, converting range plants to food for humans can only be done through livestock.

Chemistry Laboratories

Last year was no exception in the recent trend of UDA's laboratory analyses -- greater numbers of tests with the same staff, made possible through new equipment and more effort by lab employees. Although the increase in analysis count wasn't as sharp in 1988 as in 1987, it still rose by nearly 2 percent.

Test results are getting back to users more rapidly than in earlier years, with a higher degree of reliability. Utah's lab ranks in the top ten in the nation in certain types of tests which can be performed on equipment at the Utah Department of Agriculture.

With New Tests Needed, New Equipment Is a Must

The purchase, during the past year, of a GC/MS unit has given lab analysts here the ability to detect unknown chemicals in samples, as well as easing almost impossible earlier detection requests. It has made such tests much faster and more reliable.

Equipment added the previous year (an HPLC chromatograph) was especially useful during 1988. It detects sulfamethazine in milk up to parts per billion (ppb) levels; carbamates -- pesticide residues -- in produce, feed, soil, plants and groundwater; and aflatoxin in food and feed.

Other workload increases included more testing for lead in gasoline, sulfamethazine in milk, and fat in ice cream. The number of consumer complaints in 1988 nearly doubled from the previous year, increasing from 74 in 1987 to 140 last year.

New Food Safety Concerns Spotlight Lab Testing

Actress Meryl Streep's innuendos (on nationwide TV in March 1989) about the dangers of Alar use on apples was only the latest in a steady stream of publicly expressed concerns about food safety in America. And as spokespersons for animal rights, vegetarian and environmentalist groups continue to level charges at the nation's farmers, meat testing and other food analyses will continue to challenge the UDA laboratory.

Two distinct laboratory operations at UDA do testing on food products. The chemistry laboratory handles the analysis of meat and meat products, as well as running tests on feed, fertilizer and pesticides.

The bacteriology lab handles analyses of milk and dairy products; it also does water testing. Analyses for the Food and Dairy section include testing raw milk for somatic cells, bacteria count, and the presence of antibiotics. SPC and coloform tests are run on processed milk. Butterfat testing is only done occasionally, when a problem is suspected on a dairy farm.

Consumer Complaints Are an Important Test Area

Although the number of complaints from consumers is very small (140) compared to total analyses last year (35,010), they are urgent when they do come in. Reasons for such testing include suspected foreign matter in food, possible fungus problems, and a wide variety of other complaints. Lab analysts check to see if the complaints are valid and, if they are, turn the matter over to compliance officers at the department to deal with the problem.

Check Sample Testing Provides Accuracy Data

Check samples -- samples of known and unknown content to the senders -- come to the UDA laboratories from a number of sources, depending on the type of product being used. The UDA lab runs tests on them for contents requested, then Utah's findings are compared with those of other laboratories.

Although credibility was a problem for Utah's lab years ago, accuracy rates high now in the Beehive state. Besides UDA's high rating in some tests, another evidence of its accuracy lies in the fact that the present state chemist has never been called into court to testify on disputed laboratory findings; other labs verify UDA's results in cases that are heard in courts.

Quilted Clothing, Upholstered Fabric Tests Are Many

Labels on such products as down-filled hunting jackets, sleeping bags, pillows, and quilted upholstery fabrics give guarantees of content that must be checked carefully. Some involve allergies, and some involve risks to health and safety when mountain weather is a factor.

When testing such products, chemists must separate down (small feathers from geese and ducks), feathers, fiber, various types of man-made materials, etc., then calculate percentages to check label accuracy.

Testing accuracy is a major concern in these analyses and all others handled at the UDA laboratories. Quick service is another concern. These features, aided by more sophisticated equpment and computers, help assure Utahns of quality in the products they buy.

Food & Dairy

In-Store Inspections Track Food and Dairy Quality

Ten food and dairy inspectors and a small office staff provide Utah consumers with careful protection of their food supply. This unit conducts regular inspections at food and dairy outlets to assure that only wholesome, safe, properly labeled products are offered for sale here.

The inspectors regularly check about 2,100 food establishments, 740 dairy farms, and about 40 dairy plants to be sure they comply with state requirements for construction and sanitation.

Grocery stores, bakeries, meat markets, warehouses, canneries, bottling plants, warehouses, candy factories, flour mills, rabbit processors, and any other establishments that produce or sell food products at wholesale or retail are subject to UDA's food and dairy inspections.

Increasing time is being spent on inspections at Oriental food stores because of the immigration of Asiatic people in recent years.

Some of the things inspectors look for in an establishment are:

- * Proper construction for good sanitation.
- * Production of products with the use of good manufacturing practices.
- * Use of good hygiene by employees.
- * Equipment that is kept clean and in good repair.
- * Proper use and storage of toxic chemicals.

In retail outlets, inspectors watch for accurate labeling of ingredients; they eye health claims made on package labels which may be unsubstantiated or inaccurate.

Dairy inspections take place at both Grade A and manufacturing milk producers' farms. Food and dairy employees check to be sure that both the animals and the physical facilities comply with state standards. Inspectors also work with dairymen to educate them on the proper use of antibiotics and other animal drugs.

The bottom line on these inspections is that a wholesome milk product must be delivered to the dairy plants. This means that milk haulers and their trucks must also be inspected regularly to be sure proper procedures are followed, since milk quality can otherwise be reduced during transportation from farm to processing plant.

Utah's dairy plants include some of the newest and most sophisticated in the nation. Utah is an exporting state for dairy products and enjoys a fine reputation for high standards and excellent quality. This means that UDA inspectors must be knowledgeable on state-of-the-art processing equipment and procedures to protect this reputaion.

Section Inspects Meat in Sales Outlets

Although a section of UDA's Animal Health division inspects meat as it is handled in the processing plants, it falls to the Food and Dairy section to enforce Utah's meat laws and to investigate suspected violations.

Inspectors review all establishments that handle meat products, collecting samples of ground beef to be sure the meat complies with state standards. When they locate

Assuring Utahns of a clean, wholesome, safe food supply is one of the functions of UDA's food and dairy section. Inspectors visit producers, processors, transporters and retailers throughout the state.

products that don't bear the official inspection mark or which may be from uninspected sources, they investigate these violations.

Egg and Poultry Grading Takes Place at Plants, Stores

UDA's staff of egg and poultry graders work both at the processing plants and in retail stores to be sure Utahns get a supply of safe, wholesome eggs and turkey meat. (Utah has no broiler industry, although prospective producers are looking into possibilities.)

One inspector at a Salt Lake City plant keeps an eye on the dirty eggs, checks (cracked eggs), and leakers go for breaking and pasteurizing before the processor sells them to bakeries and other quantity users. The other graders divert any such eggs to that processor. (Utah has only two laying hen operations which are USDA-approved shell egg plants.)

Poultry graders spend their time at turkey processing plants in central Utah, where production is declining.

The other type of grading operation is in retail stores, where UDA employees check for grade, size and wholesomeness. At least one visit to every retail outlet every three months is the goal of the poultry and egg unit employees. The current food-and-health questions that consumers are asking themselves have created a special concern in retail store reviews -- some egg and other food packages are carrying cholesterol labeling these days, and the accuracy of such wording is subject to review by UDA.

Quilted, Upholstered Products Require Constant Watch

Studying the newspaper -- at least some of the classified ads -- every day is a way of life for the investigative officer of UDA's upholstered furniture, bedding and quilted clothing section. That's because part of his job is to keep informed on products and services in his area of responsibility that are being sold through such advertising.

State statutes require that upholsterers who renovate furniture and bedding items be licensed. The law also

How Percentages of Down Must Show on a Label * To be advertised as down-filled, a product must contain not less than 70 percent down clusters and a maximum of 10 percent down fiber, or 80 percent total. * When a label shows "80 percent down," it means 80 percent of the 70 percent down clusters required. * Thus, a product advertised as 80 percent down may only contain 56 percent down clusters, 8 percent down fiber, and the balance in waterfowl feathers or other materials.

* Read the label and understand the terms!

requires them to tag items with a green-colored owner's material tag indicating what work was done on the specific article of furniture or bedding. Those procedures are for the protection of consumers, who rely on UDA's licensing and inspection procedure to guarantee that they get what they pay for. (Licensing increased during the report year, partly due to the entrance of a large chain of discount stores into the Utah market.)

Unfortunately, some furniture renovators try to avoid the cost and scrutiny of licensing; checking furniture repair ads helps the section supervisor to track them down.

Consumers wanting to have an upholsterer make or repair furniture for them should ask to see the upholsterer's state license -- a wallet copy is provided by UDA. This assures the buyer that the supplier has been inspected and has the law tags to attach to the furniture or bedding items. The customer should look for the green tags upon completion of the job.

Down-filled items -- jackets, sleeping bags and similar items -- are another problem area for UDA. The main reason is economic, because down is one of the most expensive materials in the world. Most of it comes from China. A manufacturer of down-filled products always has the temptation present to cut costs by adulterating the down with waterfowl and landfowl feathers.

Misrepresentation of down-filled items in advertising and on hang tags is a widespread practice in the industry and requires constant vigilance on the part of UDA staff members.

Not only are the products midadvertised; many purchasers are not familiar with the terms and requirements of such products. Understanding of the loft factor -- the insulating value of down -- and percentage requirements are important. (See the box below for more information.)

Because of consumers with allergies, checking for accurate labeling of products containing synthetic fibers treated with resin is an important function of this section. Using resin to treat bulk fibers bonds the material together, helps avoid shifting inside the product, and adds weight, which increases the revenue from such materials. But resin triggers allergies and needs to be mentioned on the label.

New Staff Investigator Aids in Law Compliance

During the winter of 1988-89, UDA added a trained investigator to its staff to help track down and correct violations of the state statutes. He is working on motor fuel compliance and investigating health foods sold in Utah, which is one of the biggest markets in the nation for such products.

The new man is also responsible for the "Products of Utah" program which requires people who buy products from farmers but who don't pay in cash must be bonded and licensed by the state. All agricultural sellers should check on a buyer's license and bond unless they are being paid in cash or a cashier's check or money order.

Marketing & Promotion

Economic development, declared by the governor as Utah's number one priority, is also the main target of UDA's Marketing and Promotion division. Expanding markets both inside the state -- with the "Utah Works" program and action on increasing in-state processing facilities -- and outside are targets of division activity.

Several foreign trade delegations have visited Utah in recent months to investigate purchases of beef, fruit, hay and other commodities. Pacific Rim nations are especially interested in Utah products. In a recently completed transaction, a Japanese importer bought a pen of beef cattle for feeding and slaughter in the Beehive state, then shipment of the meat to Japan for distribution to retail store chains.

"Utah Works" Is On the Move

Customers visiting the grand opening of a new store south of Salt Lake City in the spring of 1989 were greeted by a huge in-store promotion of Utah products. The occa-

sion was the kickoff of phase two in this long-range effort to get Utahns to buy Utah products and services.

The first phase of "Utah Works" was a mass media advertising campaign to acquaint Utah consumers with the wide variety of products manufactured or processed here. It also encouraged businessmen to use

Utah products in their stores, where an equal choice is available.

The second phase of the program will expand the enrollment of businesses using point-of-sale promotional material and including the "Utah Works" logo in their own mass media advertising. Mailings are going out to about 1,400 businesses in the state. As the report year ended, another schedule was ready to start in the mass media.

UDA Appoints Groups to Promote Beef Overseas

Hoping to increase the sale of Utah beef abroad -especially in the Orient, Utah's Commissioner of Agriculture signed a contract this spring with a state and a national organization, working as a team, to promote local beef overseas. The contract was also signed by the state director of Community and Economic Development.

The Meat Export Federation, a national group already with offices in Asia, and the Utah Beef Council successfully campaigned for a \$50,000 promotion contract with UDA's marketing division.

Japan already buys a high percentage of this nation's

food exports, and the main sales effort on beef will focus on that country, which in 1991 will remove all limits to beef imports. Japanese consumers fit into two distinct markets -- older consumers who want the traditional beef, heavily marbled with fat, and the under-40 buyers who serve larger portions of leaner (and less expensive) American-style meat. Because the latter type is what cattle feeders in Utah and the rest of the nation are producing, the new promotional campaign will lean toward that buyer group.

Division Working to Put Together Sheep Project

During the past year, an East Coast tannery approached Utah officials in hopes of building a plant in the state to process about 200 pelts a day into leather. A Brigham City wool processor quickly agreed to handle the wool, but the search for both a source of that many animals and a market for the meat proved more complicated.

UDA's marketing director worked with sheep industry representatives on the challenge. Two processing plants were located, one in northern Utah and one in the southeastern part of the state. But because most Utah lamb feeders have long-established markets for their animals, and because the market for meat is so competitive, negotiations were still going on at the end of the report year for a solution.

Cherry Producers Take a New Marketing Direction

Utah's growers of tart cherries -- now being called red cherries because "tart" doesn't translate well into Japanese -- have voted to join a new research and marketing group intent on expanding both the number of processed products and the volume of sales to Pacific Rim countries.

That group, the Cherry Marketing Institute (CMI) has already developed such new products as cherry-almond sausage, cherry mustard, and cherry-almond paste for croissants.

Utah growers have approved doubling their promotional assessment from \$5 to \$10 per ton to meet the CMI funding level. A producer referendum is being prepared for submission to the legislature, with a proposal that voters must either have at least 300 tart cherry trees or sell part of ther crop to a processor.

Plant Industry

Insect pests. Noxious weeds. Plant diseases. Seeds that germinate poorly. Unhealthy nursery plants. Grain that's below the grade at which it's priced. Feeds and fertilizers that don't contain what the label says. Agricultural chemicals that aren't registed in Utah.

These are only some of the problems UDA's Plant Industry division covers in its efforts to protect sellers and buyers, producers and consumers, the environment and business, and other groups from a variety of risks.

Utah state law contains 12 agricultural statutes; eight of them fall under this division's responsibilities. An office staff of specialists in pesticides and fertilizers; noxious weeds and fresh fruit and vegetable inspection; entomology; and grain, seed and feed inspection plus a field staff of 15 agricultural inspectors carry out this work.

Entomology

Utah's invasion by gypsy moths was the highest-profile infestation problem during the past year. The moths threatened to defoliate and kill not only orchards and forest areas but expensive landscaping at a terrible financial loss to food producers and homeowners.

Control efforts included an extensive trapping program, aerial spraying of the east bench in Salt Lake county during the spring of 1989, and a quarantine in the same area that required inspection of recreational vehicles and other items moving out of the infested area. Some spraying also took place in Davis and Utah counties. Instead of using a chemical, UDA and cooperating agencies used a naturally occurring bacterium which is only harmful to certain insects, Bacillus thuringiensis or Bt.

Other less-publicized but important insect control campaigns focused on Russian wheat aphids, grasshoppers and Mormon crickets. Spraying with Di-syston last fall to control the aphids that attacked wheat and barley in Box Elder county aroused some controversy with environmentalists, but the inspect pests didn't appear in the spring of 1989, saving costs to farmers and the need for further use of the chemical (as of June 1989).

The Plant Industry division again hired temporary fieldmen to spray and put out bait for grasshoppers and crickets during the spring and summer of 1989. Costing well below the national figure per acre, Utah's program has been effective in reducing losses to these insects.

Protecting Utah's place in the export market for apples is an on-going apple maggot survey and detection program which was operated again in 1988-'89. Last year, the survey of adults included traps in 14,000 trees. Since the program's start in 1985, about 45,000 trees have been removed from abandoned and uncared-for orchards. About 250 fruit growers are counseled every year on orchard spray management techniques.

About 35,000 bee colonies owned by 747 licensed beekeepers came under the bee inspection program in 1988. Utah's rigid inspection program has kept disease conditions under 1 percent, and survey results have been negative in inspections for Varroa mite, a serious threat to honey production.

Fertilizers

Every fertilizer and soil amendment product sold in Utah must be registered with the Plant Industry division. UDA also licenses and regulates fertilizer blenders, monitors fertilizer applicators, works closely with the state chemist on fertilizer analyses, and visits retail outlets to collect samples and check on licenses.

Last year, 1,563 different products were registered in the state by some 220 manufacturers. Of the 434 samples analyzed, 36 failed to meet the label guarantee.

Commercial Feeds

When farmers and ranchers buy commercial feed, they assume that the feed is of good quality and that the nutritional content is up to what they are paying for. The Plant Industry division safeguards that trust by registering feed manufacturers and testing feed samples.

In 1988, UDA registered 3,508 feed products and tested 506 feed samples -- some packaged and some bulk. Of those, 44 failed to meet guarantees.

Fresh Fruit and Vegetable Inspection

This important inspection program helps protect Utah's export of fresh fruits and vegetables. Last year, more than 3,100 individual inspections checked the quality of onions, sweet and tart cherries, peaches, apples and apricots. Of that number, some 2,200 inspections were on tart cherries.

Inspectors issue an official inspection certificate that serves as a third-party verification in case of a dispute over quality and condition of the shipment.

These inspections are usually done at a processing or shipping facility, but they are sometimes done on individual farms. Since a high percentage of Utah's fruit production is shipped out-of-state, the inspections are important to Utah's economy.

Grain Inspection

Utah's grain inspection facility, located at 17th Street and Wall Ave. in Ogden, increased its number of graded samples and miscellaneous tests by about 6 percent last year. Part of the increase is due to a new mechanized testing facility that speeds up testing as well as reducing safety hazards in winter weather.

Before the new mechanized, indoor grain probe was

installed, employees had to climb up on icy trucks in an outdoor area during the winter to pull samples, sometimes slipping and falling. Now a hydraulically operated probe vacuums several samples from the truck and sends them into the grading lab through a pneumatic tube.

There, testers check for moisture, protein content, foreign matter, and insect damage, then issue a certificate that protects both the seller and buyer of the grain.

Nursery Inspection

Anyone who visits a nursery or garden supply department in the spring can understand the importance of the division's nursery inspection program. UDA licenses all firms and individuals selling nursery stock -- 483 licensees in 1988 -- and inspectors visit nurseries to check on proper labeling, condition of the plants, and freedom from serious insect and disease pests.

The inspection certificates they issue make the interstate shipment of stock possible.

Pesticides

Probably no other section of the Plant Industry division comes under as much scrutiny as its pesticide regulatory work. Both the Environmental Protection Agency (EPA) and private environmental and wildlife groups take a keen interest in this area.

Utah's program of pesticide applicator training and certification has been given high praise by EPA, which oversees the program nationally. As a result of 21 applicator training sessions last year, 403 people were recertified and 750 certified for the first time.

In addition, the division licenses and monitors pesticide dealers (88 were registered in 1988) and registers all pesticide products offered for sale in Utah. Last year, 6,566 products were registered by 637 manufacturers; 117 were new products.

Division inspectors checked 1,202 sales establishments and collected 158 pesticide samples for laboratory analysis.

Of 124 investgations of pesticide use, only 16 were found to be in violation of federal or state regulations.

Seed Testing

City homeowners as well as farmers and ranchers can buy seed in Utah with confidence because of the activities of this section. UDA employees conducted 2,045 inspections at 638 seed sales outlets last year.

In the seed laboratory, 2,846 samples underwent testing for percent of germination, purity, and presence of noxious weed seeds. This testing assures that the seed falls within label guarantees. Laboratory tests totaled 8,538, of which 133 were in violation of their label.

Nearly 2-1/3 million pounds of seed had representative samples taken last year.

Noxious Weed Control

Coordination of the weed control activities by county weed organizations and UDA's agricultural inspectors around the state falls to the division weed specialist. His goal is to enforce the state's noxious weed law, which is a protective measure for crop and livestock producers.

Much of the noxious weed problem in Utah arises on state and federal land, where livestock grazing makes weed control an economic issue. Since about 70 percent of Utah's land area is government-owned, forage quality on public rangeland can both increase the feeding value of grazing land and reduce livestock losses to toxic weeds.

Ag inspectors made 852 visits and inspections in 1988, including contacts with the U.S. Bureau of Land Management and Forest Service, which manage two-thirds of Utah's land area. Research continues at Utah State University on control of the state's most serious weeds.

Miscellaneous Activities

Plant Industry's 15 inspectors check fresh produce on sale in grocery stores and fruit stands to assure quality. They also visit farms, orchards and dealers to strengthen UDA's relations with the agribusiness community.

At division headquarters, specialists answer countless questions by telephone, correspondence and personal contact. They also attend and conduct many meetings to inform the public as well as producers on regulations.

UDA's Division of Plant Industry, through its programs of inspection and regulation, allows farmers to buy seed, fertilizer, agricultural chemicals and other inputs vital to a good crop with confidence in their quality.

Weights & Measures

Every commercial weighing, measuring, counting and timing device in Utah comes under the scrutiny of UDA's division of Weights and Measures. The division checks the accuracy of such widely different devices as postal scales, LP gas pumps, fabric meters in sewing centers, livestock scales, taxi meters, and parking meters.

Besides that, the division regulates every non-food product coming into Utah from out-of-state to be sure the weight or measure stated on the label (number of ounces, feet, etc.) match what's in the package.

Motor fuel regulation -- a third area of responsibility for Weights and Measures -- has been in the spotlight recently because the division found that a few gas stations in Utah were selling unleaded gas as regular, leaded fuel.

Division Aims for Once-a-Year Testing

Checking all such devices at least once a year is the goal of the division. Many items, such as grocery and meat scales, are checked much more often; a seal is applied to such scales to assure the public that they weigh accurately.

Devices that are moved, such as scales for cement batch plants and construction trucks, must be checked each time they are relocated.

To handle this work, the division has about 13 inspectors and laboratory technicians traveling the state and operating three laboratories at the Salt Lake City headquarters: cryogenic (vapor meter testing), motor fuel, and metrology -- checking standard weights and other measurement devices.

Thousands of devices were inspected during the report year, and many thousands of retail packages and bulk commodities were checked for proper quantity and accurate labeling.

Besides doing inspections and laboratory testing, Weights and Measures employees are constantly looking for better ways to do their job. Although the division budget doesn't always permit the purchase of equipment, employees find ways to get the job done. One inspector, for instance, turned a back-breaking, six-hour task into an easy twohour job by designing and building a hydraulically operated weight cart. The self-propelled machine holds two 1,000-pound weights for checking livestock scales. Since the scales must be tested with weights in opposite corners of the pen as well as with them together, the inspector can get more work done in a day now with far less safety hazards.

Law Provides Problem-Solving Options

When a weights and measures inspector finds a problem -- for example, the length of binder twine in a bale may be less than the label states, he has the store manager remove the product from the sales floor first. The inspector then tries to determine if the error is intentional or due to faulty equipment, negligence, poor training, or another cause. He cautions the store manager to correct the problem. If follow-up inspection reveals the problem is still present, UDA's options under state law include writing a warning letter, issuing an administrative order to cease and desits, or even levying a fine and settlement agreement.

Consumer protection is important to the division, of course, but so is protection of the good name of a business. UDA inspectors tend to work with a business owner to clear up problems without endangering employees' jobs or cutting off a source of tax revenue for the community, county and state.

Problems encountered by weights and measures inspectors during the past year have included:

* Windshield washer solvent that doesn't give protection down to the temperature listed on the label.

* Accurate measurement of firewood. Most firewood is sold by the cord (defined as a pile 4'x 4'x 8'), but consumers often neglect to check. Sale by the pound would be more accurate in some cases, division officials believe.

* Unleaded gasoline sold through regular gas pumps, as mentioned above.

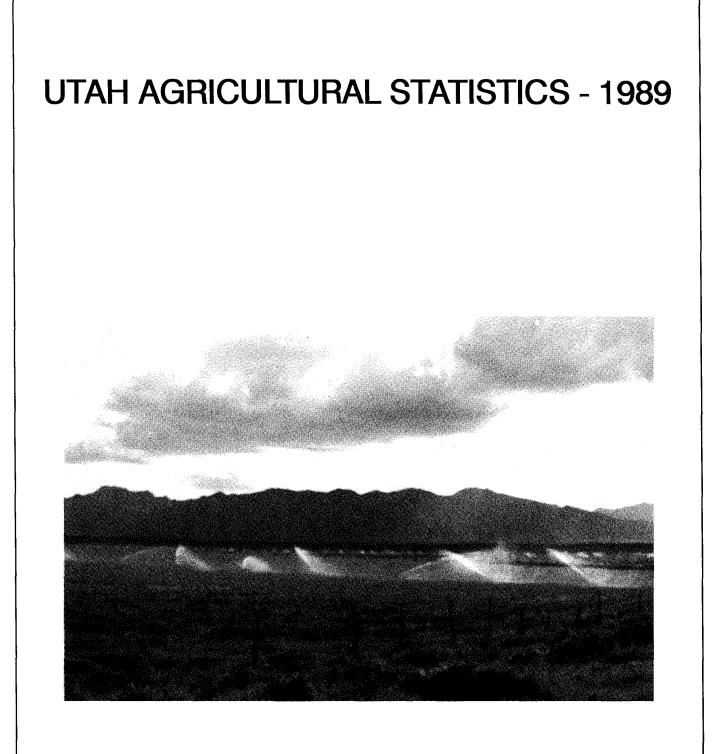

* Rapidly growing numbers of devices to be inspected, as more gas stations and other retail outlets are built.

LOOKING AHEAD

Division goals for the coming year include the following: * Additional safety devices on the three large trucks used for checking big devices. The trucks are always heavily loaded and are on the highway a lot. One is equipped with magnetic retarders (braking devices), and another will get the retarders this coming year.

* Careful inspection of motor fuels, partly to avoid recent problems with one grade being sold from two pumps and partly because of the probable return of in-pump blending, especially with alcohol fuels. If an alcohol blend is put in a car's gas tank withouth the tank being purged first, sludge can get into fuel lines and fuel pumps.

* Possible new equipment to read bar codes on grocery store products and print them on sheets of paper for checking at check-out scanners to verify correct pricing in the store's computer. The present method requires pulling containers off the shelf to check at the scanner, then returning them to the shelves. The new equipment would save much time.

Utah Crop Production Index (1977 = 100).

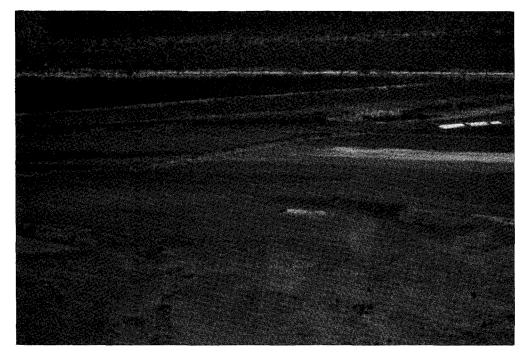

NUMBER OF FARMS

This country has seen a dramatic trend downward in the number of farms. The current count is about one-third of the number estimated in the early 1900's. Land in farms has also been on the decline, but to a lesser extent than number of farms; while the average size of farms has doubled since 1950.

Farm number statistics are based on the official definition of a farm, which is also used by the Census of Agriculture. This definition of \$1,000 or more of sales has been used since 1975. The data are collected each year as a part of the June Agricultural Survey to set State and National estimates of farm numbers.

The number of farms in the United States in 1988 was estimated at 2.16 million, down 1 percent from the 2.18 million in 1987. Total land in farms for 1988 was 999 million acres, down fractionally from 1987. Since the number of farms has declined at a faster rate than land in farms, the average size of farms has increased from 461 acres in 1987 to 463 acres in 1988.

Utah has not followed the recent U.S. trend to larger farms. The trend to larger units in the late 70's until 1982 was tempered by the number of farmers continuing to operate smaller units while employed off-farm. Farm numbers remained stable, at 14,000, from 1982 to 1984 when several years of weather problems, low commodity prices, and falling land values caused a small decline to 13,900 farms in 1985. Farm numbers declined further to 13,700 in 1986 and to 13,300 in 1988. Total land in farms has fallen 9 percent since 1980. The average size of farms decreased steadily from 1,000 acres in 1975, 832 acres in 1986, and to 831 acres in 1987. In 1988 the average size farm of 850 acres indicates a reversal of this trend.

1/1850-1931 from U.S. Census of Agriculture--1940-88 are USDA estimates. 2/ Starting in 1975, the figures are based on the "new definition" which is a place with annual sales of agricultural products of \$1,000 or more. Prior to this definition "a farm" included places of 10 or more acres that had annual sales of agricultural products of \$50 or more and places of less than 10 acres that had annual sales of \$250 or more. 3/ Preliminary.

FARM INCOME

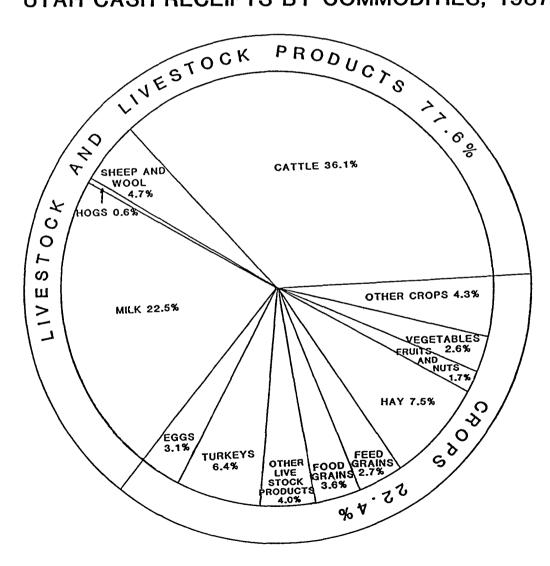

Cash receipts from the marketing of Utah farm commodities totaled a record high \$619 million during 1988, according to preliminary data released by USDA's Economic Research Service. This was 4 percent above the 1987 record high. Cash receipts from livestock, of \$456 million, were down 1.4 percent from the 1987 high. Cash receipts from crops, at \$149 million, were up 12 percent from 1987.

Utah's gross farm income during 1987 was \$751.1 million, 3 percent above 1986 and 3 percent above the 1984 high. Net farm income of \$176.2 million compared with \$128.7 million in 1986. Total production expenses during 1987 were \$574.9 million, 4 percent below those of 1986.

The graph below displays the predominance of livestock in Utah's agricultural economy. Livestock accounted for 77.6 percent of farm cash receipts in 1987--up from 76.8 percent in 1986. Cattle was the single largest contributing commodity, producing 36.1 percent of the cash receipts. Milk was second, with 20.9 percent of the receipts; followed by turkeys, with 6.4 percent. Hay remained the largest cash producing crop and was the third highest contributing commodity overall.

FIELD CROPS

Statewide, moisture was normal to slightly above in the early months of the growing season. However, the northern district--where a large part of the grains are grown--was below normal from June until the end of harvest. Early spring seeded grains did well for the most part, with enough moisture to get the crop to harvest. Late seeded grains were hurt by the high temperatures in July and August. Crops grown on nonirrigated lands suffered the most. Irrigated crops did better, but some irrigation water supplies were inadequate. The northern counties were very hot and dry during August and September, going into the winter months with low soil moisture reserves.

<u>Hay</u> remains Utah's largest cash crop. A large part of the Utah crop is fed to Utah livestock herds, but a sizeable market has developed in neighboring States and overseas for baled and pelleted alfalfa. <u>Alfalfa hay</u> was up 15,000 acres to 480,000 acres. Yields averaged 3.9 tons per acre, down from the record high of 4.1 tons the previous year. Total production of 1.9 million tons was 2 percent below 1987. <u>Other hay</u> harvested was down 20,000 acres to 140,000 acres. Yield of 1.9 tons per acre was .2 ton below 1987. Production was down 21 percent. <u>All hay</u> brought an average price of \$74.50 per ton. Total value of all hay was \$159.3 million, up 6 percent from 1987.

Small Grains: Planted acreage for wheat was down 13 percent, barley was down 9 percent, but oat planted acreage was up 14 percent. Yields were below 1988 record yields for all small grain crops, except oats harvested for grain. Winter wheat acreage, at 160,000, was 20,000 acres below 1987 and yields were down 7.0 bushels per acre. Production fell 24 percent to 5.6 million bushels. Value of production rose 11 percent to \$20.4 million. Spring wheat harvested acres were down 7,000 acres from 1987 to 22,000. Yields were down 3 bushels per acre and production was down 465,000 bushels to 1.2 million. At an average price of \$3.50 per bushel, the total value of the crop, at \$4.16 million, was down 1 percent from 1987. <u>Barley</u> acreage harvested, at 125,000, was 17,000 below 1987. Production of 9.6 million bushels was down 18 percent from 1987. Barley prices averaged \$2.70 per bushel to give a total value of \$26.0 million--up 20 percent from 1987. Oat acreage of 32,000 was up 4,000 acres from 1987, but acreage harvested for grain remained the same at 14,000. Yield of 72 bushels per acre was up 3.0 bushels per acre from 1987--equal to the record high yield of 1986. Average price, at \$2.60 per bushel, placed a value of production at \$2.6 million, up 60 percent from 1987.

<u>Corn</u> acres planted for all purposes remained at 70,000, but acres harvested for grain increased 2,000 acres to 22,000. Yields were down 16.0 bushels per acre, with total production of 2.7 million bushels--a decrease of 3 percent from 1987. The average bushel price, at \$3.30, set the value of production at \$9.0 million--up 34 percent from last year. Total <u>corn silage</u> production from 47,000 acres was 940,000 tons compared with 987,000 tons in 1987. The value, at \$21.6 million, compared with \$21.7 million in 1987. The average price of \$23.00 per ton was up \$1.00 per ton.

NA = Not Available. 1/ Includes stocks at mills, elevators, warehouses, terminals, processors, and CCC owned grain at bin sites. Utah on farm estimates were discontinued starting April 1, 1986, but are included in the National total. 2/ Estimates available June 30, 1989. 3/ All quarterly estimates except June 1 discontinued starting April 1, 1986. However, starting June 1, 1988, quarterly estimates for September 1, December 1, and March 1 were made. 4/ Only June 1 stocks estimates available after April 1, 1986.

FRUITS

The 1988 Utah fruit crop was below the 1987 level due largely to smaller apple, pear, and tart cherry crops; but all crops were at the average. A late freeze in the south cut peach and apricot crops, but good crops were reported in the northern growing areas.

<u>Apple</u> production, at 40.0 million pounds, was well below the 1987 State record of 68.0 million pounds set last year. Utilized production was 37.0 million pounds. Producers received an average price of 11.5 cents per pound--4.1 cents per pound above last year. The total value of utilized production, at \$4.26 million, was \$380,000 below the 1987 crop.

<u>Apricots</u> in Utah were caught with a late freeze in the southern district, but State production of 1,200 tons was up 9 percent from 1987. Utilized production of 1,000 tons was up 11 percent from 1987. Producers received \$380 per ton to bring the total value to \$376,000, down \$2,000 from the previous year.

<u>Peach</u> production of 11.0 million pounds was up 5 percent from the 1987 total. Utilized production totaled 10.8 million pounds, up 1.3 million pounds from 1987. Growers received an average of 19 cents per pound, which was up 3 cents per pound from last year. The value of the crop, at \$2.05 million, was \$53,000 above 1987.

<u>Pear</u> production, at 2,000 tons, was well below the previous year's 3,600 tons, and the lowest since 1978. For the 1988 crop, growers received \$384 per ton--a new record high average price. Total value of utilized production, at \$768,000, was \$102,000 below the 1987 value.

<u>Sweet Cherry</u> producers harvested 2,000 tons, 11 percent above 1987. The average price received by growers was \$776 per ton, up \$109 per ton from 1987. The value of production, at \$1.5 million, was up \$324,000 from 1987.

Tart cherry production totaled 11 million pounds, down 62 percent from last year's crop and the lowest since 1982. An estimated 9.6 million pounds were utilized. Producers received an average of 19 cents per pound, compared with 8.3 cents per pound for the 1987 crop. The value of the crop was \$1.8 million--10 percent above the value of the 1987 record production.

VEGETABLES

Onion production in Utah for 1988 totaled 594,000 hundredweight (cwt.), down 28 percent from the 1987 crop but 27 percent above the 1986 total. Utah farmers planted 1,900 acres and harvested 1,800 acres, both 100 acres more than last year. The 1988 yield of 330 cwt. per acre was 155 cwt. below the record high yield of 1987 and 5 cwt. per acre below the 1986 yield. Growers received \$9 per cwt. compared with \$8.27 per cwt. a year ago, and \$10.60 per cwt. in 1986. Total value of the 1988 crop was \$4.6 million.

Utah growers produced 7,890 tons of vegetables for processing, on 2,400 acres. This accounted for a total value of \$1.1 million, down 16 percent from the previous year.

CATTLE AND CALVES

Cattle and calf inventory on farms and ranches in Utah totaled 770,000 head on January 1, 1989, up 1 percent from the previous year. Last year's level of 760,000 head was the lowest level since 1968. The cow inventory, at 389,000 head, was down slightly from last year's level of 391.000. The losses in cow numbers came in the area of beef cows which, at 315,000 head, were down 3,000 head from last year's level. Milk cow numbers, however, were estimated at 74,000 head--up 1,000 from January 1, 1988. Much of the increase in cattle and calf inventory came in the category of heifers weighing 500 pounds or more. Beef cow replacement heifers in this category were estimated at 56,000 head, up 10 percent from last year. Milk cow replacements, at 39,000 head, increased 11 Other heifers inventory was estimated at percent from a year ago. 44,000--2,000 head above January 1, 1988. The number of steers weighing 500 pounds and over also increased to a January 1, 1989, level of 94,000 head--a 4 percent increase from a year ago. Bulls, at 21,000 head, were up 3,000 head. Calves weighing less than 500 pounds, on hand as of January 1, were at 127,000 head--down 5 percent from last year.

The 1988 calf crop in Utah totaled 352,000 head, up slightly from the 1987 crop of 350,000 head. Cattle and calves on full feed for slaughter totaled 48,000 head, compared with 45,000 on January 1, 1988.

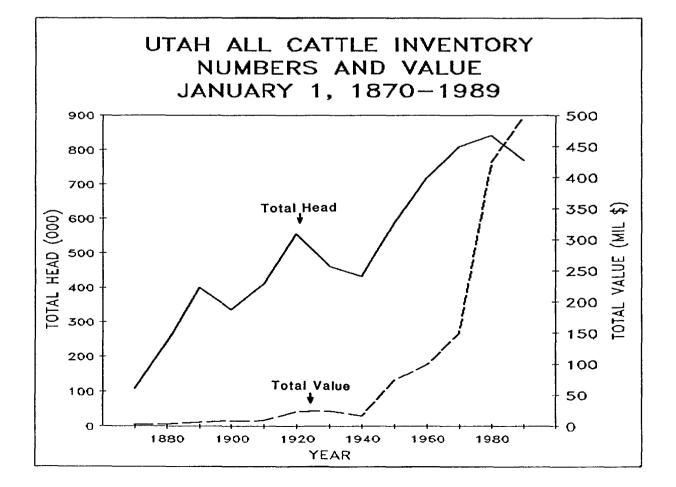

The 1988 estimate of the number of Utah cattle operations was 8,500--down 100 from the previous year. Using an average per head value of \$645, the total inventory was valued at \$496.7 million, a 20 percent increase over last year.

Total beef production in Utah during 1988 was 315 million pounds live weight--8 percent above 1987. Marketings during the year, at 384 million pounds, were 14 percent above the previous year. Cash receipts from 1988 cattle and calf marketings, at \$267 million, were 24 percent above 1987 receipts.

 $\underline{1}$ / Includes slaughter in Federally inspected plants and in other slaughter plants, but excludes animals slaughtered on farms. $\underline{2}$ / Annual data are incomplete in years that monthly data were not published to avoid disclosing individual operations. $\underline{3}$ / First year of record. $\underline{4}$ / Not printed to avoid disclosing individual operations.

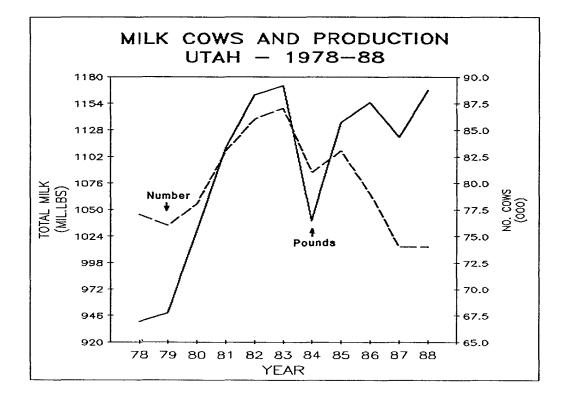

DAIRY

Utah dairy herds produced a total of 1,167 million pounds of milk in 1988, up 4 percent from the 1987 level and 4 percent above the 5-year average. The increase in milk production is attributed to an increase in milk per cow.

Production per cow, at 15,770 pounds, was up 4 percent from a year earlier, and 9 percent higher than the 5-year average. The 1988 milk fat per cow level was 571 pounds, up 27 pounds from the previous year. Milk per cow and milkfat per cow were both new highs.

Cash receipts from milk marketings during 1988 totaled \$136.4 million, up \$2.1 million from 1987, but 9 percent below the record \$150.1 million. The price per hundredweight (cwt.) of all milk was \$11.93, compared with \$12.26 received the previous year and the 1981 record high of \$13.24.

There were 21 plants manufacturing dairy products in Utah during 1988. Total cheese production of 64 million pounds was 10 percent above 1987. American cheese production, at 35.9 million pounds, was 8 percent above the previous year and accounted for 56 percent of all cheese produced. Production of Swiss cheese totaled 24 million pounds--14 percent above 1987, and 38 percent of the total cheese produced in 1988. All other types of cheese accounted for the remainder. Butter production, at 10.7 million pounds, was up 19 percent from 1987 and was at its highest level since 1938. Ice cream production was at a record 10.6 million gallons, compared with the 1987 record level of 9.8 million gallons.

SHEEP AND WOOL

Sheepmen in Utah had a total of 503,000 sheep and lambs on farms January 1, 1989, up 5 percent from last year and up 8 percent from the 1986 This marks the second consecutive year of increasing sheep record low. numbers after six years of declining inventory. The stock sheep and lamb inventory on the first day of 1989 was 480,000 head, up 4 percent from a year earlier. Most of the increase in stock sheep numbers came in the area of ewes one year old and older. They were estimated at 405,000 head, up 15,000 head from the previous year. The inventory of rams and wethers over one year of age, at 12,000 head, remained virtually the same as last year. Ewe lambs over 3 months of age were estimated at 57,000 head--up 10 percent from a year earlier. Sheep and lambs on feed for slaughter totaled 23,000 head, up 28 percent from last The 1988 lamb crop estimate was set at 380,000 head, virtually year. the same as 1987.

The State of Utah had an estimated 2,100 sheep operations in 1988, down from 2,200 in 1987. The average value per head of Utah's January 1, 1989, inventory was \$84.50, a significant drop from last year's level of \$95.50 per head. The total value of Utah's sheep inventory was \$42.5 million, down 7 percent from last year.

Cash receipts during 1988 totaled \$16.1 million, down 26 percent from 1987. Marketings, at 28.4 million pounds, were 13 percent below the previous year. The 1988 average sheep price, at \$20.00 per hundredweight (cwt.), was \$1.40 below the 1987 average. The lamb price averaged \$61.50 per cwt. during 1988, a drop of \$10.10 from the previous year.

Wool production during 1988 totaled 4.6 million pounds, 6 percent above the 1987 figure. Weight per fleece, at 9.8 pounds, was virtually the same as a year ago.

1/ Includes slaughter under Federal inspection and other commercial slaughter, excludes farm slaughter. 2/ First year on record.

Utah sheepmen were asked to categorize sheep and lamb losses by cause on a January 1, 1989, survey. The survey, sponsored by the Utah Department of Agriculture, was used to make State estimates of sheep and lamb losses in 1988.

Sheep and lamb losses totaled 79 thousand head during 1988, down 21 percent from 1987. Total losses included 22,000 undocked lambs, 27,000 docked lambs, and 30,000 sheep. The total value of all losses was \$7.1 million--20 percent below the previous year. Predators accounted for 45 percent of all losses, compared with 53 percent a year earlier. Nonpredator losses were 38 percent of the total compared with 32 percent the previous year.

Coyotes were the major cause of loss in 1988, accounting for 31 percent of all losses and a value of \$2.2 million. Weather conditions were the second leading cause and were responsible for 7,100 deaths, 800 less than last year. Other major causes of losses were lambing complications, old age, poison, and mountain lions.

All unknown causes accounted for 15 percent of undocked lamb losses. Seventeen percent of both docked lamb losses and losses to sheep were also unknown.

Sheep and Lamb Losses by Cause, Utah 1988.

1/ Value per head of \$90.00 assigned based on average of beginning of year and end of year inventory valuations.

HOGS AND PIGS

Utah's hog and pig farmers had a total of 33,000 hogs and pigs on December 1, 1988, up 27 percent from December 1, 1987. The total pig crop for 1988 was 46,000--35 percent above the 1987 figure. The large increase was due mostly to a large increase in sows farrowing and a slight increase in pigs saved per litter. The total number of sows farrowing during 1988 was 5,900, up from the 1987 level of 4,400. The number of hog farms, at 900, was virtually the same as the previous year. The total inventory value, at \$2.3 million, was 5 percent above the 1987 value.

Cash receipts for 1988, at \$3.5 million, were down 2 percent from the 1987 figure. Marketings totaled 9.2 million pounds for the year--24 percent above the preceding year. The average price for hogs and pigs during 1988 was \$37.70 per hundredweight, down \$10.00 from 1987.

CHICKENS AND EGGS

Value of eggs produced in Utah totaled \$21.4 million in 1988, a new record high. This level was 15 percent above the 1987 value of production. Production of 493 million eggs was down 1 percent from the previous year; but the average price per dozen, of 52 cents, was 7 cents above 1987. The average number of layers in 1988 was 1.95 million, 1 percent above the 1987 average. Eggs produced per layer, at 253, was down 2 percent from the previous year.

Pounds of chickens sold, at 4.3 million, was 12 percent above 1987. The average price of 6.7 cents per pound was up 12 percent from the previous year and produced a total value of sales of \$287,000.

1/ Estimates exclude broilers and cover the 12 month period January 1 through December 31--in 1970, estimating period changed to Dec. 1 previous year through Nov. 30. 2/ Includes death and other losses during the 12 month period.

TURKEYS

The value of turkeys produced in Utah during 1988 was \$48.6 million, 28 percent above the previous year, but 1 percent below the 1986 record. Production of 90 million pounds was virtually the same as 1987. Production came from 3.9 million birds with an average live weight of 23.1 pounds. The number of birds and average live weight were up 5 percent and down 5 percent, respectively.

Turkey growers received 54 cents per pound for their turkeys in 1988, up 12 cents from the 1987 price, but 10 cents below the 1986 record high. Utah turkey farms are concentrated in Sanpete and Sevier Counties--centered around hatcheries located in Moroni and Richfield. The value of turkeys produced in Utah accounts for approximately 8 percent of the total agricultural receipts.

BEES AND HONEY

Utah honey production totaled 1.5 million pounds in 1988, down 13 percent from the 1987 level. The large decrease in production was due to a 7 pound drop in honey per colony. The number of colonies, at 36,000, was up 1,000 colonies from the previous year. The value per pound of honey was estimated at 67 cents per pound--a new record high. The 1988 price was 13 cents above the 1987 price and gave Utah honey a total value of \$989,000, 8 percent above the previous year.

Several apiaries transport bees to surrounding states for legume and orchard pollination. The honey produced during these moves is counted in the estimate of the state where collected.

MINK

Utah mink farmers produced 535,400 mink pelts in 1987, placing second in the Nation for pelts produced. The 1987 figure was 12 percent above 1986. Utah also ranked second in the Nation for females bred to produce kits in 1988. There were 161,000 females bred in 1988 compared with 137,600 in 1987.

Standard was the most common type of pelt produced, accounting for 48 percent of all pelts produced in 1987. Demi-buff and Mahogany were also very popular, accounting for 21 and 9 percent of the total pelts, respectively.

There were 126 mink farms in Utah in 1987, up from 121 the previous year. The majority of all mink raised in the State are raised in five north central counties--Morgan, Summit, Salt Lake, Cache, and Utah.

FARM LABOR

Of the four survey periods between July 1988 and April 1989, the peak number of farm workers occurred in July when a total of 85,000 people were working on farms and ranches in the Mountain II Region, which includes Utah, Colorado, and Nevada. The average of all farm worker wage rates was highest in January, at \$5.16 per hour; and the lowest in July when the average was \$4.89 per hour. Farm workers paid on a hourly basis averaged over \$5 per hour in all survey periods. Farm workers paid on other basis (including salary) generally received lower hourly pay. Data for farm workers paid on a piece rate basis were insufficient for estimates in three of the four survey periods, but was the highest rate of all methods of pay in the quarter that data were available. Supervisors were the highest paid type of farm worker, earning over \$6 per hour in each survey period; while livestock and field workers received the second and third highest rates, respectively. Data on other type farm workers (including bookkeepers, maintenance, and other types of special temporary farm workers) were insufficient for estimating a wage rate in three of the four survey periods. Farm labor data, on the State level, for 1988 were not available, primarily due to budget constraints. The data are, however, published both on National and Regional levels.

AGRICULTURAL PRICES

The price data collected by the National Agricultural Statistics Service each year have a major impact on the farm industry. These prices are parts of a series, which determines deficiency payments, and are used to compute an Index of Prices Received by Farmers. This provides a single indicator of farm price trends at a given time.

Most prices after 1979 are based on actual sales by producers of a commodity during the entire month. Preliminary sales prices are obtained for the current month, based on sales around the 15th of the month. This "mid-month" price is revised the following month when sales data for the entire month become available. Livestock prices prior to 1980, and crop prices prior to 1977, are mid-month prices.

Hay prices are based on sales for the first half of the month and are not revised monthly. Wool prices are mid-month levels, and are revised annually. Prices for fluid and manufacturing grade milk are published only after data for the entire month are available. All other commodities, published on a monthly basis, follow the preliminary mid-month and revised entire month procedure outlined above. Many prices for Utah agricultural products are published only on an annual basis, because Utah produces a very small portion of the National total.

Yearly average prices for each commodity are weighted, based on the volume of sales of each commodity during a given month.

Average Prices Received by Farmers, Utah, Selected Years

1/ Mid-month average price through 1979. Prices after 1979 are revised full month prices. 2/ Average for the month. 3/ Insufficient sales.

COUNTY ESTIMATES

County estimates add another dimension to agricultural estimates. State estimates provide data for comparison with other states. County estimates provide data to compare production in the various areas within Utah. Crop county estimates play a major role in Federal Farm Program payments and Crop Insurance settlements; thus, directly effecting many farmers and ranchers. A cooperative agreement between Utah State Department of Agriculture and the Utah Agriculture Statistics Service, U.S.D.A., provides funding in support of the county estimates contained in this publication.

Box Elder County is "Number one" in both acres planted to grain and grain produced. Box Elder leads in wheat, barley, and corn for grain. Cache County is the second largest grain producer, followed by Utah, Millard, and Sanpete Counties.

Wheat production is dominated by Box Elder County, followed by Millard, Cache, Utah, and San Juan Counties.

Corn is grown in all but three of Utah's counties. Utah and Box Elder Counties together account for 38 percent of planted acres. Box Elder leads in production of grain corn, followed by Utah, Millard, Davis and Weber Counties. Utah County is first in silage production, followed by Box Elder, Cache, Sevier, and Weber Counties.

Box Elder leads all counties in 1988 for barley production. Cache County was second, followed by Utah, Millard, Sanpete, and Sevier Counties.

Duchesne County was tops in oats production. Cache County was second, followed by Uintah, Emery, Utah, and Juab Counties.

Cache County continues as the "Number one" dairy county, with over twice the number in Box Elder which ranked in second place. Utah County was third, followed by Weber and Sanpete Counties. Box Elder County is "Number one" in beef cows, followed by Rich, Duchesne, Uintah, Utah, and Millard Counties.

Sheep can be found in all counties, but Sanpete County has the most. Iron County is second, followed by Utah, Summit, and Box Elder Counties.

WEATHER

Gaylen L. Ashcroft, Associate Utah State Climatologist

Precipitation Summary: Except for the southeast, annual accumulations were about normal. In the southeast, the Uinta Basin was 78 percent of normal, the Northern Mountains was 71 percent, and the North Central Division was only 64 percent. The North Central Division was above normal for only one month during the year and the Northern Mountains was above only two months. During many months, the mountainous section of the north (North Central and Northern Mountains Divisions) was out of phase with the rest of the divisions. For example, in January, April, and August, these divisions were well below normal, but the State was generally above. In November, the opposite condition occurred. February, March, July, and October were generally dry months.

<u>Temperature Summary</u>: Annual mean temperatures were well above normal. Departures from normal, however, exhibited an unusual distribution. On both ends of the year, the winter months (January, February, and December) were colder than normal. During the nonwinter months, with the exception of September, temperatures were higher than normal.

ENTERPRISE BUDGETS

Prepared by the Economics Department, Utah State University

The following crop and livestock enterprise budgets were prepared by the Economics Department at Utah State University. These budgets are provided to help farmers and ranchers identify potential alternatives to maximize the profitability of their operation. Actual costs and income will vary from farm to farm; therefore, a column has been provided to adapt the budgets to your farm or ranch.

Any questions or suggestions to these budgets should be referred to the appropriate contact person in the Economics Department at Utah State University (phone (801) 750-2290 in Logan).

Assumptions:

Livestock investment includes 200 mother cows and seven bulls. Cows are raised and have a 10 percent cull rate. Bulls are purchased and have a 28 percent cull rate. A weaned calf crop of 80 percent is assumed. Replacement cows are selected from the calf crop.

Management practices consist of calving out in March, and selling in November. The cows and bulls are fed high protein alfalfa January-April, turned onto the range May-November, and graze the aftermath in December. Labor is provided by the operator and family.

Interest expense is based on an operating loan to cover 50% of applicable cash costs for 6 months @ 13% per annum.

Budget prepared by Doug Eck, Grant Esplin, and DeeVon Bailey in cooperation with a producer panel.

HIGH RESIDUE CONSERVATION TILLAGE INCREASES SOIL MOISTURE AND PROFITS

By V. P. Rasmussen and R. L. Newhall, Soil Sci. & Biomet, Utah State University

Erosion Control:

The 1985 Food Security Act (the current farm bill) requires high-residue (high surface-straw cover) tillage techniques for many USDA Conservation Plans that are <u>mandated</u> by <u>law</u> on HEL (highly erodible land). Landowners and operators <u>must</u> alter many of their traditional tillage practices to remain eligible for USDA programs, insurance, and disaster assistance. These techniques are so new and innovative that it was deemed advisable to include research on them in this publication.

The Soil Science & Biometeorology Department at Utah State University has been conducting tillage research and demonstration plots on several watersheds throughout the State of Utah since 1982. Generous support from the Utah State Department of Agriculture, the Utah Energy Office, the Utah Association of Conservation Districts, the USDA-Soil Conservation Service, and other groups have helped to make this an ongoing, cooperative effort. Without the support of these auxiliary groups, research and educational efforts with conservation tillage and low-input agriculture would be minimal, at best, in Utah. However, cooperative efforts, such as this, add new dimensions to agricultural production in the State. Several new, beneficial cropping systems have been developed from this research, including optimal fertilizer placement techniques, no-till drill development and comparisons, and moisture-saving chemical fallow techniques.

Two 1988 studies at different sites with different soils (one highly-eroded HEL soil and one moderately-eroded HEL soil) in the Clarkston Watershed have been summarized. The studies focused upon different ways of meeting the tillage requirements of the "Conservation Compliance" provisions of the 1985 Food Security Act. It is often difficult for growers to drastically change their established tillage patterns in order to meet the stringent requirements of farming HEL soils according to the FSA of 1985 regulations. We set out several fallow-year tillage patterns in which we computed and measured erosion and compared estimated tillage costs for each practice.

Conclusion: The chemical-fallow (no-till) treatments are better both in conserving soil and increasing profits. However, the cost of applying chemicals was low in 1988, due to the drought that limited weed growth and necessitated only one chemical treatment. The USU-recommended practice of combining tillage and chemical treatments and the chisel-only system were both within reasonable limits of cost--but they both accelerated erosion. On steep, highly erodible soils, such as these, the chemical fallow treatment is probably the method of choice. However, on slopes that are less than these, chisel plow methods can be used and still meet the FSA-85 requirements. Traditional disk and inversion plow methods are much more costly to the grower and can seldom meet the FSA-85 requirements. In addition, the measured dryland moisture savings under chemical fallow (1-2 inches per year) offer an additional incentive for growers to change their traditional methods.

Table 1 gives the tillage costs and calculated erosion values for each of the two sites. The calculations were identical to those used by the USDA-SCS to calculate conservation compliance for FSA-85 certification.

2 Conventional Tillage System - Disk

3 Conventional Tillage System - Chisel/Sweep

4 Conservation Tillage System - Chisel/Chemical Fallow

5 Conservation Tillage System - Chemical Fallow

<u>2</u>/ Site #1 (Ravsten Farm) -- Moderately eroded soil. (Soil: Mendon-Collinston Complex, 6 to 30% slopes, Class #VIe-U).
<u>3</u>/ Site #2 (Thompson Farm) -- Highly-eroded soil. (Soil: Wheelon-Collinston Complex, 10 to 30% slopes, Class #VIe-U1).

Moisture Conservation:

Moisture conservation studies have also been conducted at the Bluecreek and Nephi Experimental Farms, and at several "on-farm" Extension demonstrations across the State. These studies have shown that soil moisture (as much as 1 to 2 inches per year) can be saved with high-residue (surface mulch) conservation tillage systems.

Table #2 gives the most recent yield data from the experimental farm plots and one other (Bluecreek Field #2) located on a commercial farm near the Bluecreek Experimental Station. Note that the yields from the <u>chemical</u> <u>fallow</u> treatments generally exceed other yields. This is simply due to the moisture-saving nature of our newer chemical fallow methods.

CHEMICAL FALLOW

Cost savings and increased sales can result from using chemical fallow practices. The following worksheet was prepared by a major chemical company. It helps you analyze the potential savings on your operation.

<u>Note</u>: Only use pesticides when needed and at the rates prescribed on the label. Just because your neighbor is spraying doesn't mean you should. When you spray, you potentially kill insect friends, as well as enemies. Save the cost if spraying isn't necessary. Applying at the recommended rate can also save money. If you have questions, contact your County Agent.
