

1990 UTAH AGRICULTURAL STATISTICS

UTAH DEPARTMENT OF
AGRICULTURE
ANNUAL REPORT
ENTERPRISE BUDGETS

NORMAN H. BANGERTER
GOVERNOR

STATE OF UTAH
OFFICE OF THE GOVERNOR
SALT LAKE CITY
84114

Dear Fellow Utahn:

This publication in your hands -- the 1990 report of Utah's agriculture -- is your key to understanding the progress of one of our state's most important and productive industries. I'm pleased to have a part in helping to encourage this important industry and in bringing you this report, because I'm proud of our farmers and ranchers here in Utah. They're doing a fine job.

You'll see, as you study the book, that it contains three parts: a report of the Utah Department of Agriculture's activities for the past year, a compilation of Utah's agricultural statistics, and a section containing enterprise budgets that will help our farmers and ranchers compare their operating costs and revenues with similar operations around the state. This will lead to important improvements.

A new addition to the enterprise budget section is a set of suggested management strategies that might boost the profitability of an enterprise. And even a small increase in the percentage of profit can lead to debt reduction and improved family living. Speaking of debt reduction, it's reassuring to me to hear that farm credit is doing better than in recent years. We all hope we've reached the end of the rocky financial road that many ranchers and farmers have been on in the '80s.

It seems as though there's good news AND bad news every year in the agricultural industry. The fourth consecutive year of drought in some parts of the state is surely bad news, along with this spring's weather damage to the Utah fruit crop. But our state government, especially the Utah Department of Agriculture, is doing everything possible to ease the impact of this bad weather on our farmers and ranchers. We're seeing new range grasses developed at Utah State University that have more resistance to drought, disease and insects. Increased water storage in the near future should help even out the supply of irrigation water from year to year. And conservation tillage research will help stretch our water supply.

One new project in 1989-90 that holds a lot of promise for increased agribusiness revenue in Utah is the value-added program. Designed to keep income in Utah that has been going to other states in the past, it is helping farm producers and processors perform the added processes that make farm and ranch products worth more in the marketplace. You'll be hearing more about this in coming years.

I'm sure all Utahs join me in congratulating our state's farmers and ranchers for their productivity and perseverance against tough obstacles to put food on our table. We should think about them with gratitude at least three times a day.

Sincerely,

Norman H. Bangerter
Governor

I n t r o d u c t i o n

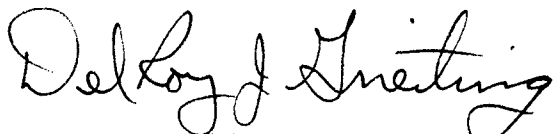

The 1987 Census of Agriculture data was published in 1989. Following the census publication, each state office of the National Agricultural Statistics Service reviews its estimates in relation to the level of the census published data. During the review, our estimates since the 1982 census are subject to revision, if necessary. In Utah we made a few generally minor revisions for the 1983-87 period.

This publication always carries the current data for all previous years. Therefore, you may wish to use this current issue for previous years' data. Contact our office if you need additional historic information.

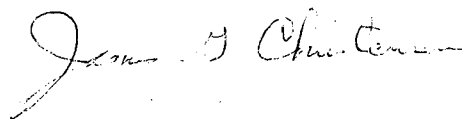

The 1990 publication is our 20th annual edition. It continues to be a cooperative effort between the Utah Agricultural Statistics Service and the Utah Department of Agriculture. The publication is divided into two parts, the Utah Department of Agriculture Annual Report and the Agriculture Statistics.

A big "thank you" to those farmers, ranchers and agricultural businesses that have voluntarily reported to us making this publication possible. Their support is certainly appreciated.

The support staff of the office are often overlooked. A special thanks goes to David Johnson, Bette Riley, and Linda Spicknall for their help in making sure that statistics data in the publication are correct.

DEPARTMENT OF AGRICULTURE
GOVERNOR'S CABINET

Norman H. Bangerter
Governor
Miles 'Cap' Ferry
Commissioner

350 North Redwood Road
Salt Lake City, Utah 84116
(801) 538-7100

Dear Friends of Utah Agriculture:

This past year has brought some important developments in Utah agriculture. Despite being in our fourth year of drought, we're seeing strong prices for cattle, milk and hay, Utah's biggest livestock and crop enterprises. Many farmers and ranchers have pulled back from the financial brink and have improved their position by reducing their debt load. Net farm income and land values have also strengthened.

Utah is making great strides in agricultural research. Construction on a new biotechnology research facility at Utah State University is complete, and equipping the laboratories is under way. Planning has started on a new animal diagnostic laboratory near USU which will add strength to the livestock industry in our state. Both those projects had financial and leadership help from our department. A number of other important research projects are under way with joint financing from the Utah Department of Agriculture and Utah State University; agribusiness is a partner in many of these projects, as well.

Many Utahns think of our department as an enforcer of state regulations, and that's an important part of the job we do. It's essential to the well-being of legitimate agricultural producers, processors, and marketers that we protect their markets from careless or unsafe products and services. Proper use of chemicals and fertilizers on the farm; clean milk production as well as processing facilities; sanitary handling of meat, poultry and eggs; correct labelling of food packages in the stores; accurate scales and measuring devices in all retail outlets; honest weight and measure in every product sold to Utah consumers -- these and many, many more aspects of business practice are under our scrutiny.

Regulation isn't our only service to the citizens of Utah, though. We work in a wide variety of other areas. Take water quality, for instance. We're working with the Environmental Protection Agency (EPA) on a study of Utah groundwater to discover what pollution sources are affecting it. (Early indications are that agriculture is doing almost no polluting of well water.) We have three scientists on loan from other agencies working in the department to measure salinity in the Colorado River and to take steps to reduce it.

Marketing and promotion of Utah products and services is another area of department activity. Not only do we have such programs as a beef marketing contract with a marketing organization for exports to Japan and around the world; we operate the "Utah Works" program to raise Utahns' awareness of all types of Utah products and services, and to encourage them to buy those items when they have an equal choice. We're emphasizing value-added processing such as Norbest's new turkey products that create new jobs in Utah rather than letting the work be done out-of-state.

This report itself is another service. Lending sources, advertising agencies, marketing specialists and others make constant use of the figures contained in it to target special messages and services to our citizens. I hope you'll find helpful information in it, as well. And I hope you'll gain a greater appreciation for the tremendous service that farmers and ranchers in Utah and across the nation perform, feeding all Americans and many people overseas with only about two percent of our work force. It allows the rest of us many choices concerning our lifestyle as well as our food.

Sincerely,

Miles "Cap" Ferry, Commissioner
Utah Department of Agriculture

Utah Department of Agriculture: Mission Statement

Test plots in a Utah State University research project help develop new range grasses and stimulate Utah's economy.

Accurate labeling, full weight or measure, and wholesome food products are assurances UDA offers Utah consumers.

Utah's fruit growers also cooperate in the campaign to protect consumers from poor products and careless processing.

This department has a three-fold mission: To conserve and develop Utah's agricultural resources; to improve Utah's agriculture and allied industries financially; and to protect consumers, producers and processors by regulating the agricultural code of the state.

Primary goals in each of the three parts of that mission are the following:

1. Conservation and Development

To protect, conserve and develop Utah's agricultural and natural resources, including water and land, among others.

2. Marketing and Promotion

To strengthen Utah's agriculture and allied industries financially by expanding present markets and developing new ones for Utah's agricultural products, locally and in the United States as well as overseas; to help develop new products and production methods; and to promote in-state processing of Utah agricultural products for a stronger state economy.

3. Regulation

To protect public health and safety as well as agricultural markets by assuring consumers of clean, safe, wholesome, and properly labeled and measured or weighed products. This includes products inspected by UDA's animal industry, plant industry, weights and measures, and food and dairy inspectors, plus other consumer products such as bedding, quilted clothing and upholstered furniture.

This inspection also protects legitimate producers and processors by keeping their markets safe from poor products and careless processing.

Commissioner's Office

1989-90 Goals and Progress

- **Open other states' borders to Utah fruits** -- Through phyto-sanitary inspection, insect and disease control, and other measures, Utah agricultural officials are increasing our sales of fruit to other Western states.
- **Storage facility for chemicals** -- Storage of new test chemicals and of completed samples and other waste is a high priority at UDA; planning headway is being made on a new chemical storage building.
- **Water-quality testing and improvement** -- On-going tests for groundwater contamination, a salinity control project for the Colorado River, and other measures are upgrading the quality of Utah's water supply.
- **Increased support for soil and water conservation districts** -- One additional resource conservation and development (RC&D) district was put into the federal program during the report year, and planning is under way for others to gain federal support.
- **Police officer training for brand inspectors** -- All full-time brand inspectors and the state veterinarian are now police-academy-certified.
- **Support for a livestock diagnostic laboratory at USU** -- Department employees helped gain approval for this important facility in legislature, and design plans are under way.
- **Value-added project for agricultural products** -- Eleven projects were partially financed by joint funds from UDA and the Department of Community and Economic Development to help reduce production costs and increase Utah's agricultural revenue.
- **Enhanced export sales of Utah farm products** -- A contract was signed during the report year to promote Utah beef in Japan and other nations; export seminars also increased exporters' know-how.
- **Increased testing of motor fuels for correct octane rating** -- The Division of Weights and Measure stepped up its testing in this area of high consumer interest to encourage correct labelling of fuel pumps.
- **Greater emphasis on food safety and proper labelling** -- Public concern over the purity of their food supply led to careful checking of retail outlets as well as processing plants for cleanliness in processing and accuracy in labelling.
- **Employee training on substance abuse and sexual harassment** -- Continued emphasis on employee training programs covered these areas of responsibility in the workplace. Videotapes on the two subjects were shown to all employees.
- **Defense of the public lands multiple-use concept** -- The commissioner and deputy commissioner not only sat in on numerous public lands meetings where grazing and other aspects of multiple use were discussed, but they also took action to maintain this practice of such

great importance to the Utah livestock industry.

- **Farm debt mediation** -- As financial problems continued to beset some of Utah's farmers, UDA administered the farm debt mediation program to help work out arrangements between lenders and borrowers to keep farms in operation.
- **Section 8 (range management) hearing process** -- This federal program to establish mediation between public land managers (BLM and the Forest Service) and grazing permit holders is helping smooth the way for livestockmen fighting to preserve this production tool.
- **Gypsy moth, grasshopper and Mormon cricket control** -- Serious infestations of these three pests and others led to a concerted effort by the department during the report year to control or eradicate such insects.

The Year's Highlights

LEGISLATURE

The department received good treatment at the hands of the 1990 state legislature as that body approved all legislation proposed by the department, as well as a number of other bills affecting agriculture. Following is a summary of all bills passed by legislature in which UDA has an interest:

HB57 - Grants 2,000 pound-per-axle overweight allowance for livestock and grain trucks on non-interstate highways in Utah.

HB61 - Creates a legislative task force to study the BLM wilderness proposal and to establish a legislative recommendation to Congress.

HB92 - Transfers administration of ports of entry from Department of Public Safety to Department of Transportation. (Will have an effect on Utah's animal identification program.)

HB95 - Prohibits coyotes and raccoons from being kept as pets in Utah.

HB130 - Exempts agricultural landowners from rollback taxes on greenbelt lands taken by eminent domain, under threat of eminent domain, or used as gifts to government entities. Imposes an in-lieu fee equal to the rollback tax on the condemning agency to go to local taxing entities.

HB140 - This housekeeping bill makes technical changes in the agricultural code, such as allowing UDA to subpoena records as well as individuals in administrative law cases.

HB153 - Appropriates \$50,000 from wildlife funds to pay for livestock losses to cougar and bear. (Payments are restricted to 50 percent of the value of lost animals to spread limited funds more evenly among claimants.) Claimants must be current in payment of the head tax on livestock.

HB383 - Deletes restrictions to whom state lands can be sold and makes noxious weed assessments non-lapsing.

HB396 - Makes it a class A misdemeanor to release commercially held fur-bearing animals without permission.

HCR2 - Re-establishes the multiple use-sustained yield principles in the administering of federal- and state-owned lands in Utah.

HCR6 - Requests the U.S. Fish and Wildlife Service to provide funding for compensation to landowners for crop damage caused by migratory water fowl.

HJR28 - Authorizes a study of the need to create a department of environmental quality to replace the division of environmental quality.

SB23 - Appropriates \$1.5 million for studies for the development of the Bear River.

SB26 - Revises the underground storage tank law by establishing an indemnity fund through the imposition of an environmental surcharge on all fuel stored in underground tanks.

SB28 - Increases the minimum bond requirement for agricultural product dealers and defining dealers better.

SB113 - Appropriates \$20 million from the general fund to rebuild the Quail Creek Dike.

SB246 - Makes Utah's meat and poultry inspection program equal to that of the USDA so as to avoid federal sanctions.

UDA officials will also keep a close watch on SB197, which establishes the authority to organize a Youth Conservation Corps in the state. YCC has value both as a source of jobs for youth and as a rural experience for city youth.

RESEARCH SUPPORT

The department supported the following research projects, mostly at Utah State University, with its \$150,000 budget for research:

Alfalfa grading -- There are several methods to analyze hay quality using laboratory equipment. This research project will help develop a technique to assess hay quality using sight techniques. The study will compare the results of laboratory analysis with on-site inspection.

Backgrounding cattle -- Instead of sending weaned calves out-of-state for further weight gain, this study is looking for the best ways to keep them in Utah by using resources within the state for higher profits.

Biotechnology Center -- Several innovative projects are being conducted under this program. Biotechnology is the leading edge of agriculture with research on hybrid plants, vaccines, animal growth and production enhancement, and food processing technology.

Commodity budgets -- Economists at USU develop cost-and-return budgets for various farm and ranch enterprises every year. These budgets, contained at the end of this report, help producers boost profits and estimate their gain from possible new ventures.

Cull cow packing feasibility -- Older cows culled from Utah beef and dairy herds have, for years, been sent outside the state for processing into ground beef and other products, then shipped back to Utah for retail sale. This study is seeking to develop packing facilities for cull cows here, to save transportation costs and make jobs in Utah.

Embryo transplant -- This research is aimed at eradicating the livestock disease of scrapie by developing scrapie-free embryos which, retransplanted into carrier ewes, will

result in disease-free lambs. Utah may also develop the embryos as a product for export.

Farm safety -- Little data exists concerning farm accidents in Utah. This project will collect and analyze information about such accidents.

Groundwater monitoring -- Because of public concern over the risk to groundwater from agricultural chemicals, this project will analyze high-risk areas for contamination and develop methods of sample analysis. Little data on this was available before the research project started.

Laboratory upgrade -- To perform the analyses required in groundwater monitoring research, a new machine (the GC/MS) was bought to analyze pesticide samples.

Pork feed feasibility -- This project is analyzing the potential to use waste products from local food processors, grocery stores, restaurants and other sources for feeding hogs. This could reduce feed costs and waste disposal problems.

Potato plots -- Potato acreages in Utah have declined in recent years. These variety studies are seeking to make the enterprise more profitable for Utah growers.

Riparian zone management -- With growing public concern over proper management of sensitive stream zones, this research seeks to develop good management

Shrub development plots -- Aimed at improving rangeland carrying capacity, this project seeks to spread the production of already-developed shrub varieties by gaining more knowledge about how to grow, cultivate and harvest them. Seed will then be marketed regionally.

ANIMAL DAMAGE CONTROL

Reported predator losses to Utah sheep, cattle and poultry producers in 1989 totaled nearly \$2 million, with coyote attacks on lambs making up more than 40 percent of that total. Coyote attacks on mature sheep added another 23 percent. All told, Utah sheepmen lost more than \$1.14 million in animals to various predatory animals and birds.

A wide variety of predators feed on Utah lambs, including coyote, bobcat, red fox, dogs, mountain lions, black bears, golden and bald eagles, ravens and badgers.

Obviously, only the larger animals prey on cattle. Losses of adult cattle were only reported (or confirmed) to coyotes and black bears, with mountain lions also accounting for some calves. Coyotes, dogs and foxes killed some \$10,700 worth of turkeys.

More than \$1.5 million was spent by the state in protecting Utah livestock, crops, human health, property and wildlife, with livestock protection taking most of it. Three fixed-wing aircraft owned by the Animal Damage Control unit of the Utah Department of Agriculture were the base for much of the control work, with rented helicopters used for some aerial gunnery.

AG IN THE CLASSROOM

Work in this program, chaired by the department information officer, has centered on publishing a teachers' handbook entitled "Utah Agriculture and Me" for the past two years. A foundation is also being organized to raise funds from public and private sources and to operate educational programs to teach children about agriculture.

Administrative Services

This division focuses on support and training for the rest of the Utah Department of Agriculture. Training emphases for the report year included avoiding sexual harassment, substance abuse prevention, and health awareness to increase the health of employees and their families while reducing health care costs.

In support services, these are the main areas of activity for the division:

- **BUDGET:** Administrative Services prepares the annual budget for the department, basing it on estimates from the various divisions. It also provides accounting and computer services so each division director will receive a monthly report on each function of the division. Administrative Services tracks twenty different programs for revenue and expenses.

- **PERSONNEL AND PAYROLL:** This function includes keeping payroll and leave records on about 160 full-time and about 50 part-time employees. The division maintains personnel and payroll records, helps with screening and interviewing job-seekers and hiring new employees, keeps tax records, etc. The division also publishes up-dated versions of policies and procedures manuals.

- **PURCHASING AND OTHER FINANCE AND ACCOUNTING FUNCTIONS:** A number of activities fall under this heading; handling the purchase of a variety of items -- from large equipment down through office supplies, making bank deposits, and keeping all travel expense records are a few. The division also makes sure UDA employees follow proper bidding and purchasing procedures and works

with the Utah Department of Administrative Services and the Department of Human Resources on the above functions.

- **DATA PROCESSING:** The staff in a special section of Administrative Services handles maintenance and upgrading of computer equipment for all divisions in the Utah Department of Agriculture. They also write programs for such special applications as brand recording (with drawings of brands), making back-up tapes of computer files several times a week, supervising computer training and purchasing schedules for all department employees, etc.

- **LICENSING:** This activity involves preparing about 10,000 renewal licenses for bedding and upholstery manufacturers, nurserymen, beekeepers, buyers of agricultural products, livestock markets, milk haulers, food processing plants, and others.

- **CONTRACTS AND ADMINISTRATIVE RULE-MAKING:** Division employees prepare contracts for outside services, such as advertising agencies, marketing organizations and others. If changes are needed in department rules, the division ensures that the proper practices are followed in filing them on time.

- **MISCELLANEOUS SERVICES:** These include managing the department motor pool, operating the mail room, maintaining equipment inventory records, overseeing telephone services, purchasing and storing office supplies and other stock items, buying and supervising audio-visual aids equipment, handling risk management (self-insurance) records, doing leave accounting, providing petty cash, applying for and securing grants, and many other duties.

Public Information

Dividing his time between internal and external communications, the department's information officer focused on these issues and situations during the report year:

- Several consecutive years of drought, with its heavy impact on Utah agriculture;
- The battle to control gypsy moths, grasshoppers and Mormon crickets;
- The continued attack on production agriculture by special interest groups such as animal rightists and opponents of the multiple-use concept for managing public land;
- On the positive side, increased marketing efforts and successes by the Utah Department of Agriculture;
- The value-added emphasis that is bringing increased agricultural processing revenue to Utah.

The information officer's activities during the report year included sending frequent news releases to the mass media and working with newspaper, radio and television reporters. He wrote speeches for the commissioner of agriculture and agricultural speeches for the governor and

lieutenant governor, plus writing a number of letters for the commissioner and governor replying to queries about farm practices such as treatment of farm animals.

During the year, he wrote or edited several publications, including the department's annual report, a revision of the Agriculture in the Classroom teachers' handbook, a flyer describing new pre-weigh-in rules for the state's junior livestock shows, an enterprise budget workbook, and others.

He placed exhibits on Utah agriculture at the Utah State Fair, the Utah Education Association convention and elsewhere. Another major audio-visual effort was in preparing several videotape segments for use at the state Capitol's agricultural exhibit and writing the script for a longer resource conservation and development videotape presentation.

As secretary-treasurer of the Utah Junior Livestock Show Association, the information officer coordinated the purchase and distribution of cattle, sheep and swine ear tags in conjunction with new rules for improving the educational value of FFA and 4-H livestock programs.

Agricultural Development and Conservation

Several different sections in this division work in widely varied areas to help improve Utah farmers' and ranchers' economic strength and to help guard the state's natural resources. Following are some of the areas assigned to the division:

- Soil conservation
- Water quality
- Agriculture resource development loans
- Rural rehabilitation loans
- Development of new water supplies
- Agricultural enterprise development
- Increased production efficiency and profitability
- Coordination of agricultural research
- Farm energy program
- Liaison with the state Agricultural Advisory Board

SOIL CONSERVATION

Utah is divided into 38 soil conservation districts, and the policy-making group in this area is the Utah Soil Conservation Commission, with its members appointed by the governor. The main function of the soil conservation section is to work with districts and other groups in helping solve problems of erosion and to teach responsible land management to farmers and ranchers.

Every year, the division helps sponsor a Conservation Field Day in an area where special projects are in operation. The 1990 event took place in Ephraim in mid-June, with a focus on riparian areas.

A program of speakers, exhibits and tours to outstanding projects explains modern farming and ranching techniques to a large group of attendees each year.

Soil protection is demonstrated at Conservation Field Day.

The soil conservation section also works with other state and federal government agencies to administer portions of the national farm bill. A new bill is being written in Congress this year; the last farm bill enacted was the U.S. Food Security Act of 1985.

That bill established a conservation reserve program and other programs to hold marginal farmland out of production for conservation purposes. When farmers sign up in that program, they are not allowed to use the set-aside land for grazing or cropping except in an emergency such as a serious drought.

Besides protecting marginal land from erosion, the conservation reserve removes land from crop production in times of excess crops; if hard times come and production is needed from those fields, they are available and give improved productivity through conservation practices.

WATER QUALITY

With public interest running high in water quality, the work of this section has increased in the past year. Groundwater testing to check for pollution from agricultural sources has been under way for much of the report year; preliminary results show that pesticide residues are lower than expected, but continued monitoring is under way.

Because much of Utah's cropland is irrigated, the nonpoint source pollution activities of this section have a major impact on the state's agricultural industry. The program helps Utah landowners and users to manage their irrigation water and waste water systems so as to fall within federal and state pollution control standards. More runoff from feedlots, dairy lounging areas, and other agricultural facilities has been controlled in recent months and years than ever before.

More than twenty watersheds in Utah have been labeled as high-priority areas for nonpoint source pollution control programs. The designation calls for a management plan, and division staff members are working with officials to complete those plans and to help carry out the practices they entail.

A team of specialists from other agencies is working in the section on a special one-year assignment: to test the salinity of the Colorado River and to effect an action program to reduce the level of the salts. The group has identified eleven geographical areas for control work.

During the year, the section added an information officer to its staff to help issue news releases and edit publications dealing with the water quality program.

AGRICULTURE RESOURCE DEVELOPMENT LOANS (ARDL)

This low-interest loan fund is administered by the Utah Department of Agriculture through this section. The purpose of the loan fund is to help Utah farmers and ranchers implement soil and water conservation practices to protect and preserve our vital natural resources.

Because four consecutive years of drought have hit Utah's farmers and ranchers hard, the 1990 legislature

Development of more efficient farm irrigation systems is just one of many approved uses for ARDL loan funds.

appropriated \$300,000 in additional loan funds to help deal with the drought conditions. That amount was added to the \$15.1 million that has built up in the ARDL loan fund over the 14 years it has been operating. Although the legislature normally doesn't specify the uses of the money, this year they requested that it go to help drought-stricken farmers and ranchers.

More than \$24 million in improvement projects have been funded over the years, and as farmers and ranchers pay their loans down, the money is lent again to maintain progress. Two loan officers work with prospects and current borrowers to help them obtain financing to implement their conservation practices.

ARDL loans have financed a wide variety of projects over the years. Some of the types of projects okayed for the program include:

- Strip-cropping systems and contour farming
- Rangeland moisture conservation and soil protection
- Reduced-tillage or no-till cropping systems
- Shallow-water areas for wildlife and wildlife habitat
- Animal waste control facilities
- Alternative chemicals and fertilizers
- Windbreak establishment and restoration
- Diversions and terraces
- Installation of irrigation systems

Loans made for rangeland improvements have helped multiply the livestock carrying capacity by several times.

RURAL REHABILITATION LOAN PROGRAM

During the Depression days of the 1930's, the federal government launched a program to help farmers hang onto their property in the difficult times. When the depression ended, the government gave the funds to the states to use as low-interest loan funds. The funds are used to help young individuals get started in farming. They are also used to help other farmers make their operations more effective through the purchase of more land, livestock or equipment.

The original federal fund was only \$300,000, but interest earnings over the half-century of its existence has allowed the revolving loan fund to reach about \$1.5 million today.

Loans are approved by the Agricultural Advisory Board and administered by the loan staff of this division.

WATER DEVELOPMENT

Utah has only one major undeveloped source of water left, the Bear River in the northern part of the state. It also flows through Wyoming and Idaho, which means that close cooperation is necessary to develop the two million acrea feet of water that flow into the Great Salt Lake in an average year.

Members of the division staff are working with water conservancy districts being authorized and set up in the affected counties to create and carry out a plan for storage and use of the Bear River water. As many as seven reservoirs might be built, over the years, to provide water for irrigation, wildlife, municipal and industrial uses.

The division also works with other water projects, such as the Central Utah Project, to help improve the productivity of the state's farm and ranch land.

RESEARCH GRANTS

State appropriations for reasearch are coordinated by the Division of Agricultural Development and Conservation, with grants going to researchers in a variety of projects. (See full listing on page 6 in this report.) This division not only tracks the funds to be sure the research is moving ahead; it also works to put the scientific findings into effect on Utah's farms and ranches, with the help of the department's Plant and Animal Industry divisions and others.

This use of tax money -- \$150,000 during the report year -- has made a big impact on Utah's agricultural revenues and on reducing costs on the state's farms and ranches. Much of the UDA-sponsored research is carried out at Utah State University, but other responsible research teams are also involved.

FARM ENERGY PROGRAM

Support for this activity of the division comes from Utah Energy Office grants. Primary types of activity include:

- Development of irrigation water management practices that conserve energy.
- Carrying out energy audits on farms and ranches to spot waste and correct it.
- Conducting educations programs on energy conservation, for both adults and children, such as Ag in the Classroom.
- Providing equipment to teach conservation tillage.

Animal Industry

This division works in four important areas in supervising and enforcing state laws and programs affecting Utah livestock and animal health:

- Animal health, with special attention to animal diseases which can be transmitted to humans.
- Serology lab testing of animal blood for disease control.
- Animal identification -- brand registration and inspection -- to discourage livestock theft.
- Meat inspection to assure consumers of wholesome meat.

Aquaculture -- growing and processing food fish -- is a relatively new industry in Utah to which the Animal Industry division is giving increasing support.

ANIMAL HEALTH

The animal health bureau is involved in controlling and eradicating livestock and poultry diseases, checking the interstate movement of animals, upgrading the quality and wholesomeness of animal food products, and safeguarding the overall public health of Utah's citizens.

Scrapie

This very serious, slow, debilitating disease of sheep (and, in some cases, cattle) may take up to two or three years in the incubation period. Although the disease hasn't been present in Utah since 1957, it is so dangerous, and the sheep industry is so important to Utah, that state officials are working with other agencies to eradicate scrapie everywhere.

The director of the Animal Industry division, who is also state veterinarian, spent three weeks in Australia in the spring of 1989 helping conduct a training course and tour concerned with this disease. World leaders on scrapie research gathered there for the training and idea exchange.

In October 1989, international scrapie research leaders attended a meeting in Texas to discuss the direction international laws may take to control the disease. They also discussed the concept of negotiated rule-making, where representatives of industry and federal and state governments meet to discuss what kinds of laws should be put into effect,

rather than federal authorities writing a proposed law, then considering state and industry suggestions.

Because of the fear of scrapie, rendering companies across the United States are no longer taking dead sheep for rendering, and they are only using sheep offal from inspected meat-packing plants. (Great Britain now has a serious problem with scrapie in cattle because of the long-time use of infected sheep carcasses in livestock feed products.)

Embryo Transfer for Scrapie Control

In this technique, being studied for possible scrapie eradication, a sheep embryo is transplanted from a donor ewe to a recipient. After the lamb is born, it must be observed for 60 months, because of the lengthy incubation period of the disease, to be sure it is really disease-free.

Researchers hope to find that the embryo is disease-free when it is transferred and that a new generation of non-diseased lambs can be used as foundation stock for clean herds. The embryo transfer technique is already being used to import superior genetics; as one researcher said, "A veterinarian can put a whole herd of superior animals in a suitcase and bring it to Utah."

Brucellosis

Utah livestock producers are fully supporting the rules for brucellosis control which were passed six years ago. The fact that Utah is a brucellosis-free state is important to the state's economy -- it means animals can be shipped in and out of the state more easily.

Vaccination protects cows from abortion and also safeguards human health. In 1989, about 140,000 beef and dairy calves were vaccinated in Utah as part of the brucellosis control campaign.

Other Diseases

Ram epididymitis, a disease affecting sheep, is under research study at Utah State University for control possibilities. Sheep foot rot is also being studied there.

A swine disease called pseudorabies is a virus which

Preventing and curing livestock diseases, whether the animals are in a feedlot or on open range, is vital for wholesome meat.

does not transmit to humans but which can be spread to cattle and other hogs. The division and the swine industry in Utah are working for total control; again, being declared a pseudorabies-free state will carry economic benefits in unrestricted interstate marketing.

Another serious problem is trichomoniasis in cattle. "Trich" is a venereal disease; a new vaccine is available and is being tested, but it is only cleared for use with females.

Because of its implications to human health, disease control work in animals not considered livestock is important to UDA and all citizens of Utah. Such species include exotic birds, rodents, snakes, wild birds, fish and others. A year ago, UDA, Wildlife Resources, and Public Health issued a joint publication dealing with the control, importation, possession and transportation (CIPT) of non-livestock animals.

SEROLOGY LABORATORY

This important laboratory conducts hundreds of tests every day to analyze animal blood for brucellosis, leptospirosis, vibriosis, anaplasmosis, bluetongue, and equine infectious anemia. The facility is vital in the Animal Industry division's battle to control animal diseases.

Identifying and controlling these diseases has a great impact on safeguarding human health. The test results are applicable to humans and are correlated with the Utah public health system.

Other diseases under the careful scrutiny of the state veterinarian are tuberculosis in pheasants, pullorum in chickens and pheasants, and avian influenza in poultry. All three have caused problems in Utah in recent years. The division also monitors cattle for tuberculosis constantly because of the disease's possible effect on humans.

UDA is also examining disease complaints in privately owned fancy chickens and game birds.

MEAT INSPECTION

Like the other food inspection services of UDA, the meat inspection bureau assures Utahns that only safe, inspected products are offered for sale in the state. Meat inspectors make sure that all meat products are wholesome, unadulterated, and properly marked, labeled and packaged.

Utah's meat inspection program has been accepted by the federal government, which labels it one of the best plans in the nation. It is saving thousands of travel dollars for Utah taxpayers through local training and certification of meat inspectors. All the people hired recently have been trained and have passed federal certification reviews right here in the state -- a process taking four to five months.

Talmage-Aiken Act

Inspectors working under this legislation are known as TA inspectors. Utah's state meat inspectors are cross-licensed as federal inspectors; because of that, provisions of the TA law allow certain packing plants in Utah to ship meat across state lines with state inspectors present in the plants. They do the federal inspection that interstate shipment requires. Most Utah packing plants don't ship out of the state and only need state inspection.

Because of the increased interest in Talmage-Aiken inspected plants, however, UDA hired another veterinarian

in meat inspection in June 1990. The department will also hire another non-veterinarian inspector in late 1990 because of the increase in the number of plants being inspected.

ANIMAL IDENTIFICATION

This bureau handles the registration and inspection of brands, often encountering livestock theft being attempted. A total of more than 37,000 brands were under registration at the end of the 1989 report year.

Ten full-time and about 45 part-time brand inspectors located all over Utah check brands at livestock auctions, ports of entry, roadblocks and elsewhere. Utah law states that all livestock owners moving or showing their animals must have proof of ownership with them; brand inspectors look at this paperwork to protect owners from theft.

As livestock thieves are finding out, UDA's enforcement of brand inspection laws is effective -- thefts are detected and

Having a good, top quality piece of meat to cut at the retail level also depends on a rigid meat inspection program.

solved quickly, with close cooperation existing between inspectors and law enforcement officers at the county and local levels. Stiff fines and jail sentences have been handed down in recent years, resulting in a sharp drop in livestock theft cases reported in 1989.

Because the livestock industry has requested it, all of Utah's full-time brand inspectors and the state veterinarian are now police academy-certified. This has always been permitted under Utah law, however, the increased enforcement was requested during recent years when thefts were increasing. This certification gives inspectors broader flexibility in their investigations.

Inspectors were able to return 1,452 cattle, 184 horses, and 220 sheep with a total value of about \$1,338,423 to their rightful owners during the report year. They also checked about 700,000 head of cattle and 21,000 horses last year as the animals were being sold, transported, exhibited or slaughtered.

Through good cross-utilization between the animal health and animal identification bureaus, brand inspectors watch for signs of health problems in livestock and report them to the state veterinarian.

Checkoff funds for beef marketing and research totaling \$600,000 were collected by brand inspectors in 1989.

This bureau is in the process of renewing 37,000 cattle, sheep and horse brands and earmarks. Following this renewal process, which ends in December 1990, the bureau will publish a master brand book for public information.

Chemistry Laboratories

With the increased concern about water quality and the Utah Department of Agriculture's interest in groundwater research, the major improvement in chemical analysis during this report year was very timely. It was the addition of testing equipment (a GC/MS unit) that can perform quick analysis of water, milk and other samples to check for the presence of pesticides and other agricultural products. Chemists can now separate malathion and parathion in a sample, for instance. Analysis for the same sample required a much longer time before the GC/MS unit was bought.

Two separate laboratories make up this division, the chemistry laboratory and the bacteriology laboratory. The first handles the analysis of meat and meat products and runs tests on feed, fertilizer and pesticide samples.

The bacteriology lab handles analyses of milk and dairy products and does water testing. It runs analyses for the department's Food and Dairy section, including testing raw milk for somatic cells, bacteria count, and the presence of antibiotics. It also runs SPC and coliform tests on processed milk. When a problem is suspected on a dairy farm, this lab also does testing for butterfat.

Lab scores No. 1 in nation for accuracy

National recognition came to this division in early 1990. High scores in check sample testing gave the Utah Department of Agriculture chemical laboratory the number one rating in feed-testing accuracy in the nation for the first four months of the year. The facility topped a list of 190 participating laboratories throughout the United States.

Check sample testing is a monthly procedure used to test chemical laboratories' accuracy and other factors. The Association of American Feed Control Officers operates the feed-testing program. It involves the association sending several samples of one type of feed each month to every lab taking part in the analysis program. Chemists at each laboratory perform quantitative analysis on the samples, using test equipment and chemicals to analyze the feed for moisture, protein, fiber, ash, salt, calcium, phosphorus and zinc.

After the labs return their analyses, AAFCO scores

Laboratory work helps most UDA divisions do their job.

them on bias, precision and accuracy, the most important factor being accuracy.

In the feed analyses from January through April 1990, UDA's laboratory ranked first in accuracy, sixth in precision and seventh in bias in the nation.

Besides checking its techniques in feed analysis, the Utah lab takes part in check sample programs in fertilizer, pesticides, meat, and dairy testing. While only the feed check sample program provides rankings for the laboratories, all of the testing programs allow participating labs to check their techniques and make corrections, if necessary.

Lab credibility helps in trial testimony

The state chemist, who is director of this division, explains that high scores in check sample testing give a laboratory credibility in court testimony when the results of lab analysis are involved in a trial. The high scores also assure consumers that analyses of food and dairy products will yield reliable results and help the state Department of Agriculture maintain safe, wholesome products on grocery store shelves.

Although consumer complaints about food and other products total less than half of 1 percent of all analyses performed by the laboratories -- about 150 a year out of some 35,000 total analyses, they are urgent when they do come in, because human health is usually involved. Reasons for such testing include suspected foreign matter in food, possible problems with fungus, and a wide range of other causes. Laboratory analysts check to see if a complaint is valid; if so, they turn the matter over to compliance officers in the department to deal with the problem.

Testing on upholstered products is critical

Labels on such products as down-filled hunting jackets, sleeping bags, pillows, and quilted upholstery fabrics give guarantees of content that must be checked carefully. Some products involve allergies, some involve risks to health and safety when mountain weather is a factor, and all involve cost. Down -- the small under-feathers of ducks and geese -- sells for one of the highest prices per pound of any product in the world, and label accuracy is usually the only way a buyer can be sure the price is fair.

When chemists test such products to check label accuracy, they must separate and weigh down, feathers, fiber, various types of man-made materials, and other contents.

Consumer concerns have led to recent increases in the number of samples analyzed for lead in gasoline, alcohol in anti-freezes (including windshield washer solvents), fat in ice cream, and sulfamethazine in milk, among others.

The laboratories are operating about at capacity, given the size of staff and amount and sophistication of equipment. And while testing accuracy is a major concern, quick service -- a short turn-around time for samples -- is also important. Test results are getting back to users more rapidly than in earlier years, with a higher degree of reliability.

All these improvements are aimed at one major goal: to help assure Utahns of quality in the products they buy.

Proper construction of milking facilities helps assure sanitary conditions on the farm and wholesome milk in the store.

Food and Dairy

Maintaining a close watch over the quality and correct labelling of Utah's retail food supply is the function of this section. With the supervision and help of a small office staff, its inspectors conduct regular inspections at dairy farms, food and dairy processing plants and outlets, poultry processing plants, egg packing plants, furniture and bedding factories, retail outlets for quilted clothing, and other businesses all across Utah.

An agricultural investigator and administrative law judge handle situations requiring legal action.

FOOD AND DAIRY INSPECTION

Ten food and dairy inspectors regularly check about 740 dairy farms, about 30 dairy processing plants, and about 2,100 food establishments. In 1989, all types of inspections added up to a total of 5,932.

Among the types of establishments that the section regulates are: grocery stores, bakeries, meat markets, warehouses, canneries, bottling plants, candy factories, flour mills, rabbit processors, and any other establishments that produce, process or sell food products at wholesale or retail.

Some of the things inspectors look for in a food establishment are:

- Proper construction for good sanitation.
- Production of products with the use of good manufacturing practices.
- Use of good hygiene by employees.
- Equipment that is kept clean and in good repair.
- Proper use and storage of toxic chemicals.

In retail food outlets, the inspectors also watch for accurate labeling of ingredients and health claims made on package labels which may be unsubstantiated or inaccurate.

Both Grade A and manufacturing milk producers'

farms are subject to regular dairy farm inspections. UDA inspectors check to be sure that both the animals and the physical facilities comply with state standards. Inspectors also help educate dairymen on the proper use of antibiotics and other animal drugs in order to avoid illegal residues in milk and other dairy products.

Delivering a wholesome milk product to the dairy plants is the final goal of all dairy farm inspections. To assure this, milk haulers and their trucks also receive regular inspections to be certain that proper procedures are followed. Otherwise, milk quality can deteriorate during transportation from farms to processing plants.

Some of the newest and most sophisticated dairy plants are located in Utah. This is an exporting state for dairy products, and Utah enjoys a fine reputation for high standards and excellent quality.

Maintaining this reputation, and the resulting revenues for the state, requires that the Utah Department of Agriculture's food and dairy inspectors stay up-to-date on the latest dairy processing equipment and procedures.

RETAIL MEAT INSPECTION

Inspecting meat processing plants falls under the Animal Industry division in UDA, but enforcing Utah's meat laws and investigating suspected violations is handled by the Food and Dairy section.

Inspectors review all establishments that handle meat products, checking on meat packages to assure that products requiring inspection have been inspected. They also check labels for accuracy and collect samples of ground beef to be sure the meat complies with state standards.

When inspectors locate products that don't bear an official meat inspection mark or which may be from an uninspected source, they investigate these violations.

This year, special watch was maintained to be sure cross-contamination, especially between meats and fish, was avoided in the stores.

EGG AND POULTRY GRADING

To be sure that Utahns get a supply of safe, wholesome eggs and turkey meat, UDA's Food and Dairy section maintains a staff of egg and poultry graders working both in processing plants and in retail stores.

Each egg processing plant in the state sends its dirty eggs, checks (cracked eggs), and leakers to one so-called breaker plant in Salt Lake City. There, an inspector keeps an eye on those eggs while they are broken and pasteurized before the processor sells them to bakeries and other large-quantity users. Utah has only one laying hen operation which is a USDA-approved shell egg plant.

Almost all Utah chickens are laying hens; the state has no commercial broiler industry. Therefore, all UDA poultry graders are in the turkey processing plants of central Utah, where production has been declining.

Another type of egg-grading operation is in the state's retail stores. UDA employees check for grade, size and wholesomeness in each store about every three months. Concern among consumers over salmonellosis has put additional importance on this type of grading. Another food safety issue is that of cholesterol content; egg graders carefully check wording on packages that refers to cholesterol to be sure the information is accurate.

One emphasis of the Food and Dairy section during the report year was to require that eggs be held at lower temperatures in retail stores by keeping them in a cooler.

BEDDING, QUILTED CLOTHING, AND

UPHOLSTERED FURNITURE INSPECTION

Utahns are able to take many things for granted when they buy products at wholesale or retail in the state. They normally assume they are getting an accurate weight or measure; wholesome foods; and safe, sanitary bedding and upholstered furniture.

One investigative officer inspects the last two items plus quilted clothing for UDA. One method he uses is to study classified and display advertising in the daily newspapers. That keeps him informed on products and services in his area of responsibility that are being sold through such advertising.

Upholsterers who renovate furniture and bedding items are required by state law to be licensed. The law also requires them to tag items they work on with a green-colored owner's material tag indicating what work was done on each specific article of furniture or bedding. Those procedures are for the protection of Utah consumers, who rely on UDA's licensing and inspection processes to guarantee that buyers get what they pay for.

Some furniture renovators try to avoid the cost and scrutiny of licensing in order to charge more than what their work is worth; checking furniture and bedding repair ads helps the supervisor of this section to track them down and enforce the law.

Ask to see the upholsterer's state license -- that's sound advice for consumers wanting to have an upholsterer

make or repair furniture for them. (A wallet-sized copy of each license is provided by UDA.) This request assures the buyer that the supplier has been inspected and has the law tags to attach to the furniture or bedding items. The customer should also check for the green tags when taking delivery of the furniture.

Down-filled items, such as winter jackets, sleeping bags and similar items, are another problem for UDA.

Most of the commercially used down -- the soft under-coating of ducks and geese -- in the world comes from China, and pound-for-pound, it is one of the most expensive items for sale in the world. For that reason, manufacturers of items advertising down content are tempted to cut costs by adulterating the down with waterfowl and landfowl feathers.

Misrepresentation of the amount of down in items offered for sale, both in advertising and on hang tags, is a widespread practice in the industry. To guard against it requires constant vigilance by the UDA inspector.

Part of the problem is that many purchasers aren't familiar with the terms and requirement of such products. Understanding the loft factor -- the insulating value of down -- and percentage requirements are important. (See box below for more information.)

WHAT TO LOOK FOR ON THE LABEL OF A PRODUCT CONTAINING DOWN

- To be advertised as down-filled, a product must contain not less than 70 percent down clusters and no more than 10 percent down fiber, or 80 percent total.
- When a label shows "80 percent down," it means that the product contains 80 percent of the 70 percent down clusters required.
- Thus, a product advertised as 80 percent down might only contain 56 percent down clusters, 8 percent down fiber, and the balance in waterfowl feathers or other materials.
- Read the label carefully, and understand the terms!

Checking for accurate labeling of products containing synthetic fibers treated with resin is necessary to protect consumers, because resin, after a period of time, will dry and flake. This can then cause sneezing in some individuals.

Treating bulk fibers with resin bonds the material together and helps avoid its shifting inside the product. It also adds weight, which usually increases the revenue from such materials. But resin triggers some allergies and needs to be mentioned on the label.

AGRICULTURAL INVESTIGATOR

With the addition of a trained and experienced investigator to the Food and Dairy section staff a little over a year ago, the enforcement of state regulations in this area has become easier. Motor fuel compliance, the purity of health foods sold in Utah, and other special areas of interest occupy a good part of his time.

Another program he enforces is the "Products of Utah" laws, which require agricultural product dealers to be licensed and bonded.

Marketing and Promotion

Working for a stronger agricultural and agribusiness economy in Utah, this division uses a variety of techniques and programs to help develop new markets for Utah products and increase sales in the markets already being reached.

Following are brief reports on some of the programs and materials created to encourage economic development in Utah agriculture.

“UTAH WORKS”

While advertising funds are not being maintained at the start-up level for this three-year-old program, its logo is still being added to new cooperators' products and packages, encouraging Utahns to choose a Utah product or service when they have an equal choice.

More than 180 businesses -- food processors, retail grocers, clothing manufacturers, and many other types -- have signed up in the program, and 2,000 stores have received shelf talkers, window decals, banners, product markers and other promotional material. Cooperators use the logo in their advertising, on calendars, on labels and in other ways.

Mass media campaigns have focused on the wide variety of Utah businesses, on logo recognition, and on the advantages of patronizing Utah suppliers.

EXPORT PROMOTION

Efforts to increase sales of Utah products overseas have taken several directions during the report year.

In one program, the Utah Department of Agriculture and Utah Department of Community and Economic Development have entered a joint contract with the U.S. Meat Export Federation. That national group has offices in Asia and is promoting Utah beef around the world, especially in Pacific Rim nations where much of the West's export products go.

Major beef promotions in Japanese stores have led to increased purchase there of American-type beef, which is leaner, healthier, and much lower in price than the wagyu beef that Japanese consumers have traditionally bought. Many families in Japan had never tasted American-type beef until the Meat Export Federation and other groups gave out samples in the stores.

Sales of U.S. beef have multiplied in the Pacific Rim and will continue to increase -- Japanese trade barriers to large imports of foreign beef will lift in April 1991.

Feeding tests are also being conducted in Utah to try to meet the traditional Oriental market for beef with heavy fat marbling. Cattle are being fed in Cache county for slaughter and processing there and for shipment to a Japanese grocery chain which owns an interest in the feeding operation.

Other export-promoting projects include an export seminar at Utah State University in early 1990, jointly sponsored by UDA, the university, and other groups. A regional beef export seminar was held in Sun Valley a few weeks later, with good attendance from the Beehive state.

Federal TEA funds -- trade enhancement assistance --

are available to Utah exporters. A few companies are already taking advantage of the marketing assistance; others are investigating the possibility.

HAY MARKETING PROGRAM

Encouraging hay buyers and sellers to get in contact with each other, UDA's marketing and promotion division has just published a hay directory with separate sections for farmers who have supplies of hay for sale and livestockmen looking for sources of supply. The list of buyers includes both in-state and out-of-state names, addresses and phone numbers.

Not only will the new directory encourage more agricultural revenue for Utahns; it has also helped build a mailing list of livestockmen for other promotional efforts by the division.

LAMB PROCESSING PLANTS

Utah, sixth in the nation in sheep and lamb numbers and a good consumer of lamb, has gone for years without a packing plant that would handle enough carcasses to come close to meeting market demand.

During the report year, packing plants began processing lamb in Laketown, Spanish Fork and Springville, Utah. The state is still importing lamb from Colorado and other Western states, and efforts continue to keep those processing dollars and jobs in-state to boost the Utah economy. As with other products, paying shipping costs to send animals out of state, then to bring the meat back to Utah, raises consumer costs and deprives Utahns of jobs they could hold here.

VALUE-ADDED PROJECT

This project is encouraging farm producers and food processors to keep some of the processing work in Utah that has been done outside the state in years past.

Although a freeze in April 1990 destroyed a large percentage of the state's fruit crop, several projects are underway to process jellies, jams, syrups and other items. New fish products are being put on the market by Utah's trout hatcheries, partly with funding for new equipment from this project. A real stimulus for the Utah economy, this program will probably grow during coming years.

Utah has joined a national tart cherry marketing program.

Plant Industry

Utah's state law contains 12 agricultural statutes, and eight of them are enforced by this division. They cover insect pests, noxious weeds, plant diseases, seeds, feeds, fertilizers, agricultural chemicals, nursery plants, grain grading, and other areas requiring inspection, licensing and enforcement.

Carrying out this responsibility protects the state's plant producers, middlemen and consumers. To do it, the Plant Industry division employs a wide variety of staff members. Specialists in pesticides and fertilizers; noxious weeds; fresh fruit and vegetable inspection; entomology; and grain, seed and feed inspection plus a field staff of 15 agricultural inspectors carry out this work.

ENTOMOLOGY

Several insect pests are at the infestation level in Utah this year. Gypsy moths threaten the Wasatch Front watershed, forests, orchards and private home landscaping. Grasshoppers and Mormon crickets are attacking crops and rangeland in almost every section of Utah. Russian wheat aphids, black grass beetles and others are high in population in the state.

At the same time, some effective agricultural chemicals are being taken off the market, either voluntarily by the manufacturers or by Environmental Protection Agency (EPA) action. Each loss of a chemical, without a suitable replacement, costs consumers additional food dollars, economists affirm.

The current report year is the second year of gypsy moth control efforts. Extensive trapping in 1989 confirmed infestations in Davis, Salt Lake and Utah counties, and a cooperative control effort between local, state and federal government agencies has resulted. This year's spray program is covering more than 20,000 acres; a companion quarantine requires inspection of recreational vehicles and other egg-carrying materials moving out of a 150,000-acre area.

Van Burgess, director of Plant Industry for UDA and coordinator of the gypsy moth program, estimates that it will take three to four more years of control measures to

Spraying for gypsy moths will save home landscaping, forests.

eradicate the insect, which has destroyed hundreds of thousands of acres of trees in the Northeast.

Use of poison bait in populated areas and aerial spraying in remote areas is helping to control grasshoppers and Mormon crickets, but the loss is devastating in heavily infested areas. Several temporary UDA workers are handling control efforts in locations all over the state. The 1989 fall adult grasshopper survey indicated that Utah had about 114,000 acres infested with grasshoppers and 24,000 acres infested with Mormon crickets.

A new computer and a special mapping program are helping division employees to produce maps outlining the insect problems and to plan control strategies. Several UDA employees plus representatives of other government agencies received training on the new equipment in April 1990 and made immediate use of the technology for insect control.

A program to control apple maggot in Utah orchards moved forward during the report year. Part of the problem has been the legal difficulty of removing abandoned orchards held by absentee owners. Action by the governor and the commissioner of agriculture removed some legal barriers.

Since the program started in 1985, about 50,000 trees have been removed. About 250 fruit growers receive counsel each year on orchard spray management.

Utah's bee colonies are inspected rigidly each year to control the Varroa mite, a serious threat to the state's honey production. Disease conditions are very low here -- under 1 percent.

FERTILIZERS

The Plant Industry division registered 1,558 different fertilizer and soil amendment products from 241 manufacturers in 1989. On 996 visits to dealers around the state, inspectors collected 377 samples for analysis; only 31 failed to meet label guarantees. The division also licenses fertilizer blenders.

COMMERCIAL FEEDS

Plant Industry division employees registered 3,995 different feed products from 504 suppliers in 1989, an increase in products of about 14 percent over the previous year. Inspectors made 1,164 inspection trips to 548 establishments. They collected and tested 438 feed samples during the year, some packaged and some bulk; of those, 48 failed to meet guarantees, and sales of eight products were placed under a Hold Order.

Utah livestock owners have to assume, when they buy commercial feed, that the product is of good quality and that the nutritional content is what is represented to them. UDA safeguards that trust by conducting its program of registration and inspection diligently throughout the year.

FRESH FRUIT AND VEGETABLE INSPECTION

Every year, the division staff makes several thousand inspections of tart and sweet cherries, onions, apples, peaches and seed potatoes to protect the state's export markets for

Taking fertilizer samples is part of an ag inspector's job.

fruit. Inspectors issue a certificate that serves as a third-party verification of grade in case of a dispute over quality and condition of a shipment.

These inspections are usually done at a processing or shipping facility, but they are sometimes performed on individual farms. The program is important to Utah's economy because a high percentage of Utah's fruit production is shipped out-of-state.

GRAIN INSPECTION

This work of the division is done at the grain inspection facility in Ogden, where new sampling and testing equipment has sped up the process of grain testing.

Samples of grain taken from truckloads pulling through the enclosed building are checked for moisture and protein content, foreign matter, and insect damage. Testers then issue an inspection certificate that protects both the seller and buyer of the grain.

Due to the continuing drought in Utah, the number of samples tested in 1988-89 was down from the previous year. Not only was grain production reduced in the state -- with every county being declared a disaster area -- but many livestock owners bought less grain, having reduced the size of their herds because of poor grazing conditions.

NURSERY INSPECTION

Every year, the division licenses all firms and individuals selling nursery stock. Licenses totaled 483 in 1989. Inspectors also visit those nurseries to enforce state laws pertaining to labeling, healthy condition of plant stock, and freedom from serious insect and disease pests. They provide inspection certificates to permit interstate shipment of stock.

PESTICIDES

Environmental and wildlife groups and the EPA scrutinize the division's work with pesticides closely because of their concern for the environment. The division licenses and monitors pesticide dealers, issuing licenses to 649 pesticide manufacturers in 1989 for a total of 6,667 products. Of those, 101 were new products cleared after investigation.

Staff members made 1,107 inspections of pesticide

sales establishments and collected a total of 189 samples.

Another activity of the division in this area is to conduct pesticide applicator training and certification. EPA, which oversees this program nationally, has singled out the Utah program for high praise. In 19 training sessions around the state in 1989, a total of 787 new applicators were certified and 694 applicators recertified. Of a total of 213 investigations of pesticide use, only 28 violations were found.

New chemistry laboratory equipment has allowed much faster analysis of water and other liquids for pesticide residues; that lab work indicated very low residues in groundwater -- always below safe tolerances.

SEED TESTING

In this area as in other inspection programs, consumer confidence is the goal, especially since so many city homeowners buy small quantities of seeds without studying the products as most farmers do. UDA employees conducted 2,062 inspections at 638 seed sales outlets in 1989.

In the seed laboratory at the Utah Department of Agriculture building, analysts tested 2,694 samples, conducting 8,820 different tests to check for label accuracy. Only 112 violations were determined. Besides the lab tests, 583 samples were taken in a drill box survey in farm fields.

Analysts in the state seed laboratory have completed the giant work of cataloging 1,400 samples of farm, garden, tree and shrub seeds in UDA's seed herbarium and converting the catalog to a computer database for easier reference.

NOXIOUS WEED CONTROL

Controlling the worst of Utah's many varieties of weeds is a joint effort by county weed organizations, federal land-management agencies (BLM and the Forest Service), private landowners, and the division's weed specialist, who coordinates the activities. The goal of the weed specialist is to enforce the state's noxious weed law, a protective measure to help the crop and livestock producers.

On private cropland, greater profit from higher yields is the motivation for weed control. The same motivation exists for ranchers grazing livestock on public land; higher-quality forage increases the feeding value of grazing allotments, and weed control cuts losses of animals to toxic plants.

Much of Utah's noxious weed problem occurs on state and federal land, which makes up about 70 percent of the total land area in Utah. To work out the control problems, the weed specialist coordinates interaction between the division's agricultural inspectors and U.S. government agencies, utility companies, county weed supervisors and boards, and private landowners.

In 1989, inspectors made 1,710 visits to these groups and to weed infestation areas for inspections. They also conducted surveys of the more serious infestations and worked with Extension and research personnel to encourage the use of the most effective control methods.

MISCELLANEOUS ACTIVITIES

Division employees also check fresh produce at grocery stores and fruit stands, attend community and state agricultural meetings, take part in training workshops, and act as goodwill representatives for the department.

Weights & Measures

Three major areas of activity take up most of the time of UDA's Weights and Measures division employees:

- Inspecting and certifying all commercial weighing, measuring, counting and timing devices in Utah.
- Inspecting all food and non-food products sold in Utah to be sure the weight or measure on the label matches the contents of the package.
- Regulating motor fuels to verify that the contents and octane rating are as represented at the pump.

INSPECTING AND CERTIFYING DEVICES

The variety of types of equipment which the division's inspectors check and certify is as great as the creativity of the nation's inventors. Some are obvious, such as grocery store and postal scales, parking meter timing devices, and scales at cement batch plants. (All portable scales have to be checked every time they're moved.)

Others are less apparent -- belt scales at mines, taxi meters, propane pumps at service stations, pill-counters in pharmacies, railroad scales, and fabric meters in dry goods stores, among countless others.

The division aims to check all such devices in the state at least once a year. Many items, such as grocery and meat scales and fuel pumps, are checked much more often; a seal is applied to such devices to assure the public that they weigh or measure accurately.

To handle this work, the division has about 13 inspectors and laboratory technicians traveling the state and operating three laboratories in the Salt Lake City department headquarters. Those laboratories are:

Cryogenic (vapor meter testing)

Motor fuel lab

Metrology (checking standard weights and other measurement devices used in inspections)

Thousands of devices are inspected each year on location all over the state, where items are sold commercially. Several weight trucks take large weights around to check such scales as those at livestock auctions and concrete plants; a self-propelled, hydraulically operated weight cart invented by a division employee eases the task of getting the weights in and out of buildings.

New equipment for checking scanners in grocery stores has just been acquired by the division. Formerly, inspectors had to pull containers off the shelves, making a note of shelf prices, then carry them to a check-out counter to verify that the correct price was read by the scanner and entered in the store's computer. Finally, the inspectors returned the products

to the shelves. Now, division employees will use a portable wand to record the bar code information from the product and punch in the shelf price, then verify the pricing without moving the actual products.

CHECKING LABELS ON FOOD AND NON-FOOD PRODUCTS

Every year, a few special problems show up in the state's retail trade that cause increased testing to take place for the products involved. The accurate measurement of firewood is an example. If wood is sold by the cord, a pile should measure 8 feet long by 4 feet wide by 4 feet high. But consumers seldom check because the wood usually isn't stacked neatly by the supplier.

Another area being inspected carefully, with the help of chemical laboratory testing, is the anti-freeze protection of windshield washer solvents. Analyses indicate that very few give protection to the lowest temperature specified on the container label.

The division checks the number of pills in a bottle, the length of clothesline in a package, the number of tacks in a box, and every other type of non-food packaging. Its inspectors make thousands of tests on retail packages and bulk commodities every year.

MOTOR FUEL REGULATION

In the last two or three years, a number of consumer complaints have led to increased testing in this area. Inspectors found regular, leaded gasoline being sold as unleaded fuel, for example. The current phasing out of regular gas may reduce complaints somewhat, but the new unleaded fuels will still make testing by the division necessary.

As the number of service stations continues to increase rapidly, along with convenience stores with gas pumps, this type of inspection will continue to be in more demand.

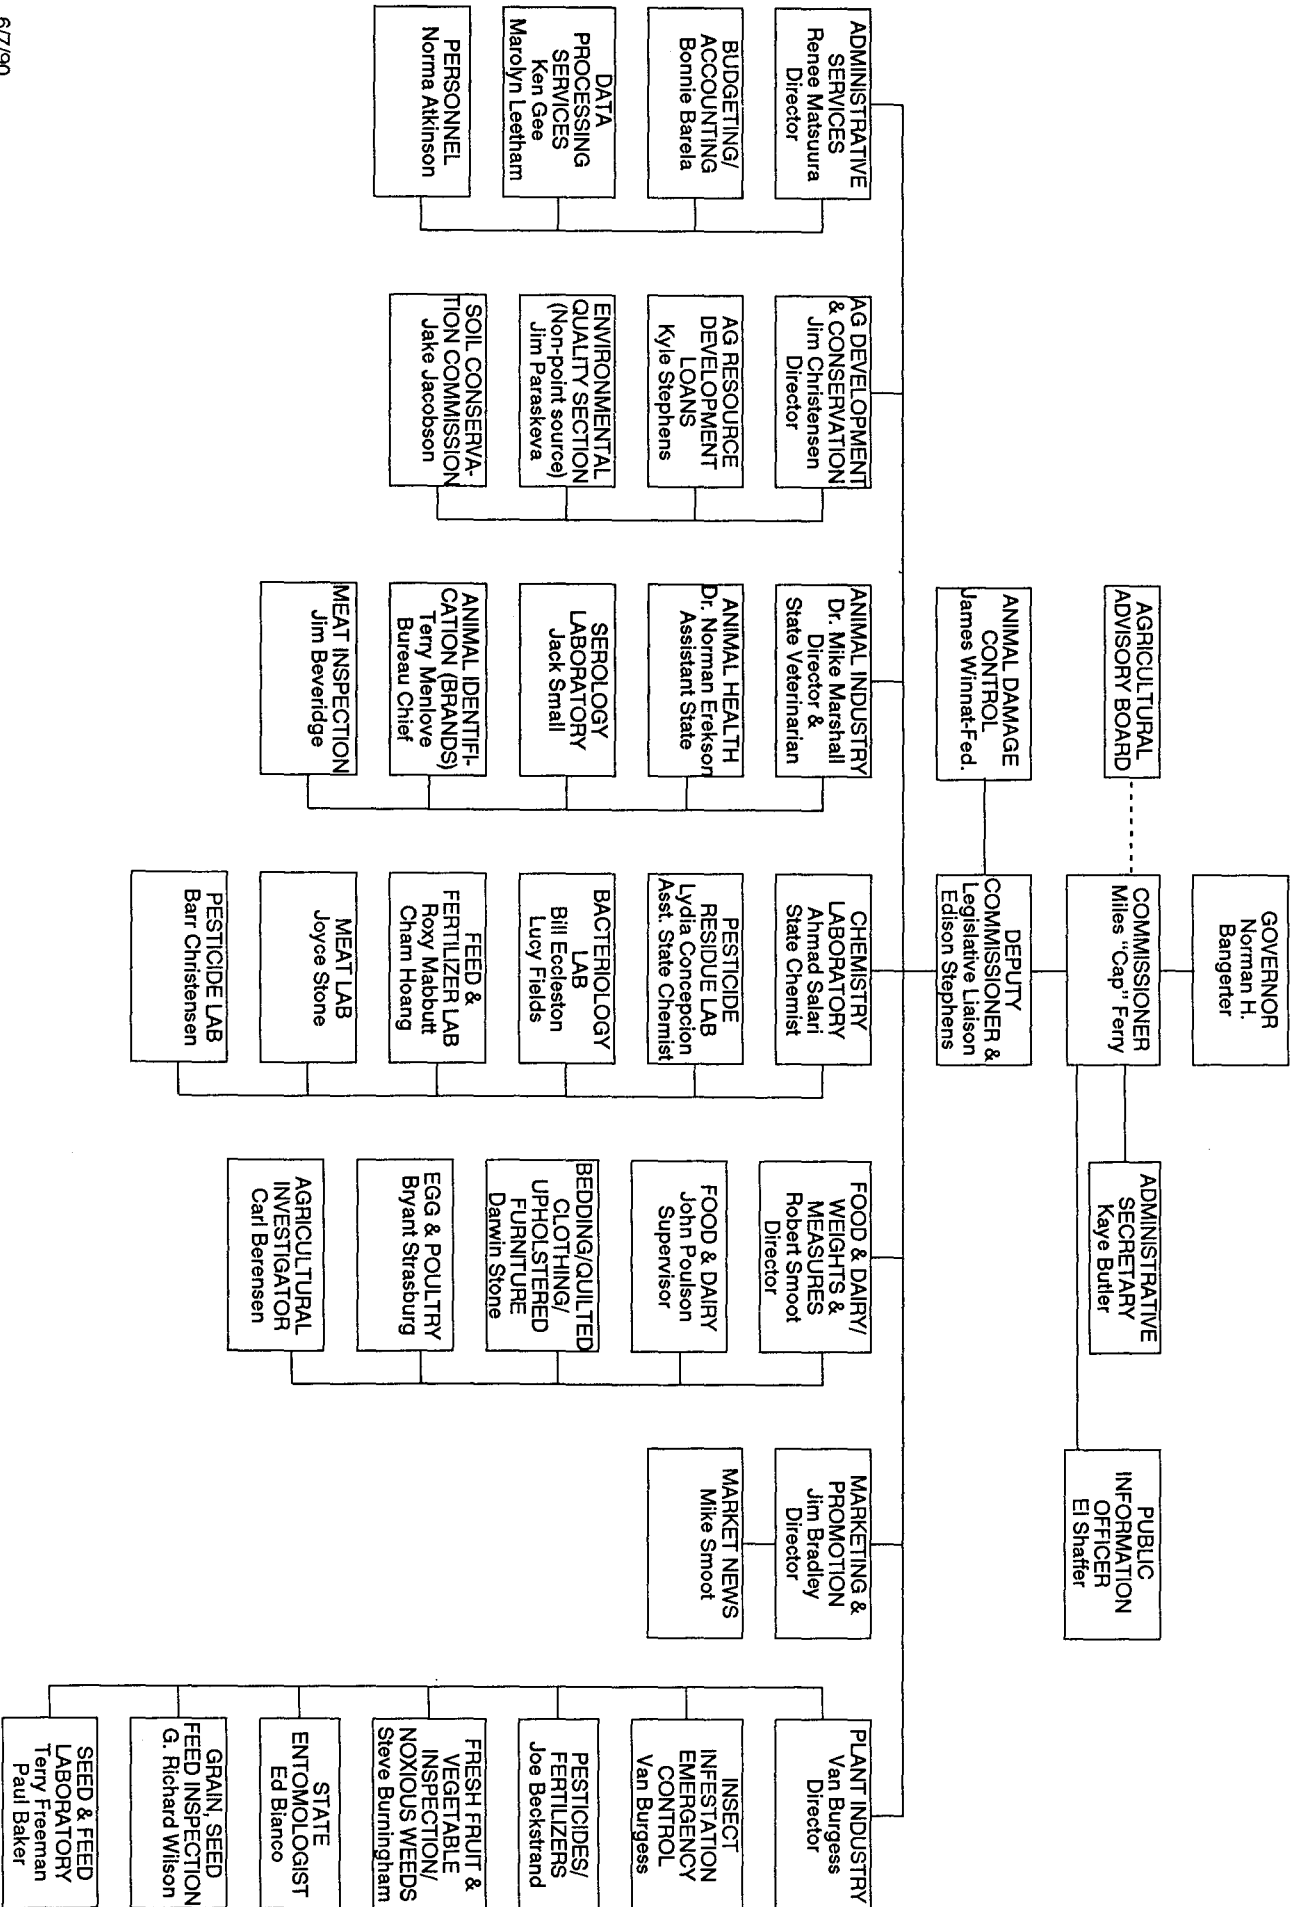

SOLVING PROBLEMS

When a weights and measures inspector finds a problem -- for example, the number of clothespins in a package is less than the label states, he first has the store manager remove the product from the sales floor. The inspector then tries to determine if the error is intentional or due to faulty equipment, negligence, poor training or another cause. If the problem is in-store, he cautions the store manager to correct it; if the problem comes from outside, he or another division employee will try to get the label corrected.

If follow-up inspection reveals that the problem is still present, UDA's options under state law include writing a warning letter, issuing an administrative order to cease and desist, or even levying a fine and settlement agreement.

Consumer protection is important to the division, of course, but so is protection of the good name of a business. Inspectors tend to work with a business owner to clear up problems without endangering employees' jobs or cutting off a source of community, county and state tax revenue.

UTAH CROP PRODUCTION INDEX

1977 = 100

Number of Farms

The number of farms in Utah in 1989 is estimated at 13,000, down 2 percent from 13,300 in 1988. Total land in farms for 1989 is 11.3 million acres, unchanged from last year. The average size of farms in Utah followed national trends of increased size, moving from 850 to 869 acres. This is the second consecutive year that average farm size has increased following 11 years of decreasing size in the Beehive State.

Nationally, farm numbers for 1989 are forecast at 2.17 million, down one percent from 1988. Total land in farms for the United States is 991 million acres, down fractionally from 1988. Since the number of farms has declined at a faster rate than land in farms, the average size of farms has increased from 453 to 456 acres in 1989. This marks the 8th consecutive year that average farm size has increased at the national level.

^{1/} 1850-1931 from U.S. Census of Agriculture--1940-89 are USDA estimates.

^{2/} Starting in 1975, the figures are based on the "new definition" which is a place with annual sales of agricultural products of \$1,000 or more. Prior to this definition "a farm" included places of 10 or more acres that had annual sales of agricultural products of \$50 or more and places of less than 10 acres that had annual sales of \$250 or more. ^{3/} Preliminary.

Farm Income

Marketing of Utah crops and livestock in 1989 produced cash receipts totaling \$711.0 million, according to preliminary data released by USDA's Economic Research Service. This was 3 percent above the 1988 level, and marks the third consecutive record breaking year. Cash receipts from livestock of \$555.3 million were up 3 percent from 1988. Cash receipts from crops, at \$155.7 million were also up 3 percent from the previous year.

Gross farm income in Utah during 1988 was \$830.9 million, up 10 percent from the record high set in 1987. Net farm income of \$186.7 million, compared with \$173.5 million in 1987. Total production expenses during 1988 were \$644.2 million, 11 percent above those of 1987.

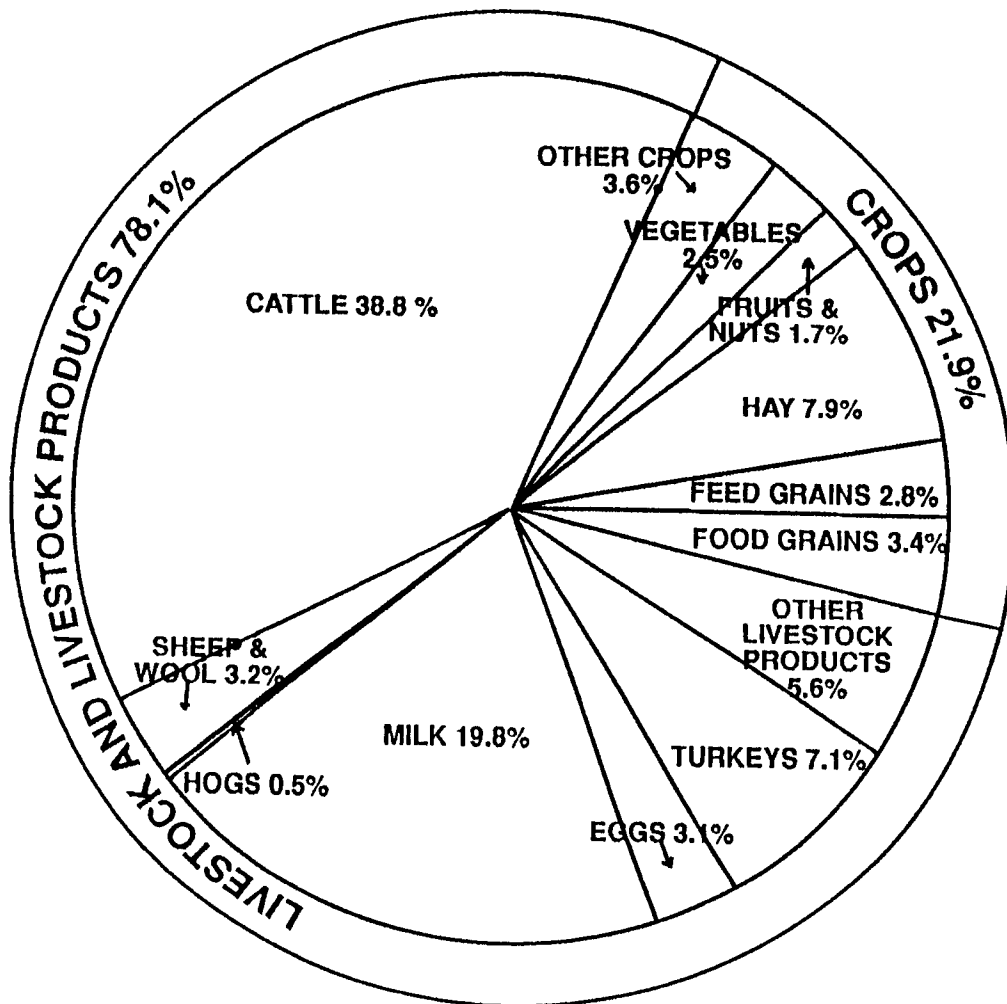

EXPENSES, GROSS AND NET INCOME

FROM UTAH FARMS 1982-1988

Utah Cash Receipts by Commodities, 1988

The graph below displays the predominance of livestock in Utah's agricultural economy. Livestock accounted for 78.1 percent of farm cash receipts in 1988--up from 77.6 percent in 1987. Cattle was the single largest contributing commodity, producing 38.8 percent of the cash receipts. Milk was second, with 19.8 percent of the receipts; followed by turkeys, with 7.1 percent. Hay remained the largest cash producing crop and was the third highest contributing commodity overall.

Field Crops

Water year accumulation in the northern half of Utah was about normal, and the southern half was about three-fourths of normal at the beginning of the cropping season. This was a contrast to the 1988 season, when the southern district averaged 123 percent normal, and the northern district was about two-thirds of normal. Alfalfa and winter wheat made good early growth, but there was concern about late freeze damage. Plantings and seedings were behind the fast pace of 1988 due to low soil temperature, but near the 5 year average. Irrigation began in the second week of April to assist emergence of corn in several districts, and bring the alfalfa crop to first cutting. Temperatures were above normal in early June, and precipitation was below normal. This situation continued until early September, creating severe drought conditions in southeast and eastern districts. Nonirrigated crops suffered the most in all counties, and shortage of irrigation water cut yields severely in several counties. Water reserves at the end of the cropping year were very low, and soil moisture carryin for next year was below normal.

Hay remains Utah's largest cash crop. While a large part of the crop is fed to Utah's livestock herds, a portion is marketed to neighboring states and overseas as pelleted and baled alfalfa. Alfalfa hay harvested was down 20,000 acres to 470,000 acres. Yields averaged 3.70 tons per acre, compared with 3.90 tons last year. Total production of 1.7 million tons was down 9 percent from 1988. Other hay harvested at 130,000 acres, compared with 140,000 acres harvested in 1988. Average yields of 1.90 tons per acre was the same as last year. Production of 247,000 tons, was down 7 percent from the previous year. The 1989 all hay crop was valued at \$165.8 million, which was up \$400,000 from 1988.

Small grains: Planted acreage for wheat was the same, barley was down 4 percent, but oat planted acreage was up 13 percent. Yields for wheat were lower, but barley and oats were higher. Winter wheat harvested acreage at 155,000, was the same as 1988, and yields were down 4.0 bushels per acre. Total production of 5.0 million bushels was 11 percent below 1988. Value of production dropped 14 percent to \$18.0 million. Spring wheat harvested acres of 22,000 were the same as 1988. Yield of 45 bushels per acre, compared with 1988's yield of 54 bushels, and the record high of 57 bushels in 1987. Production of 990,000 bushels is down from the previous year's 1.2 million. Value of production of \$3.6 million was down 18 percent from 1988. Barley acreage harvested at 114,000 was 11,000 acres below 1988. Production of 9.0 million bushels was down 6 percent, even though average yield of 79 bushel per acre was 2 bushels above the previous year. Value of production at \$19.4 million was down 24 percent from 1988. Oat production at 1.3 million bushel, was up 25 percent from 1988, and the largest production since 1958. Yield, at 74 bushels per acre, was up 2.0 bushels from 1988 for a new record high. Growers harvested 17,000 acres for grain, up 21 percent from last year. The value of production was down 17 percent to \$2.1 million.

Corn acreage planted for all purposes at 65,000 acres, was down 7 percent from 1988. Acreage harvested for grain at 20,000, compared with 22,000 acres a year ago. Yields were up 8 bushels per acre from 1988. Total grain production of 2.6 million bushels, was 3 percent below 1988. The crop was valued at \$7.1 million, down 17 percent from last year. Total corn silage production from 44,000 acres at 836,000 tons, compared with 940,000 tons in 1988. The value of the crop was \$20.1 million, compared with \$21.6 million in 1988.

NA = Not Available. 1/ Includes stocks at mills, elevators, warehouses, terminals, processors, and CCC owned grain at bin sites. Utah on farm estimates were discontinued starting April 1, 1986, but are included in the National total. 2/ Estimates available June 30, 1990.

Fruits

Utah's 1989 fruit crop showed mixed changes from the previous year, as cold February temperatures damaged soft fruit crops such as peaches, apricots, and sweet cherries. However, more hardy fruits such as apples, pears, and tart cherries suffered little damage, and mostly good crops were reported.

Apple production at 56 million pounds, was up 40 percent from 1988, and rated as the seventh largest apple crop in Utah history. Utilized production was 54 million pounds. Producers received an average price of 10.9 cents per pound, 1.6 cents lower than last year. The total value of utilized production at \$5.9 million, was 21 percent higher than the previous year.

Apricots decreased by 20 percent from 1988 to a level of 400 tons in 1989. Utilized production was 350 tons. Producers received an average of \$470 per ton, 90 dollars per ton less than the previous year. Total value of production was \$165,000, up 9 percent from 1988.

Peach production at 11.0 million pounds, was down 12 percent from 1988. Utilized production at 10.5 million pounds was 11 percent below the previous year. Average price per pound was 21.5 cents, bringing total value of the crop to \$2.3 million, one percent higher than in 1988.

Pears in Utah at 2,600 tons, were 30 percent higher than the year before. The average price received by growers was \$340 per ton, 44 dollars less than 1988. Total value for the crop was \$884,000, 15 percent higher than a year earlier.

Sweet Cherry producers harvested 1,700 tons, 300 tons less than 1988. Utilized production was 1,600 tons. Average price received by growers was \$800 per ton, up \$24 from the previous year. The total value of the crop was \$1.3 million dollars, 15 percent lower than 1988.

Tart cherry production was 24.0 million pounds, 118 percent higher than 1988, and equal to the second largest crop ever. Utilized production was 22.5 million pounds. Tart cherry prices for the 1989 crop will not be published until July 10, 1990.

Vegetables

The 1989 Utah onion crop at 748,000 hundredweight (cwt.), was the third largest crop ever recorded in the State. Total production in 1989 was 9 percent higher than 1988. Utah farmers planted 1,800 acres in 1989, and harvested 1,700, with a yield of 440 cwt. per acre. Growers received an average of \$7.60 per cwt., and total value of the crop was \$5.0 million, up 4 percent from 1988.

Production of vegetables for processing in 1989 was 7,270 tons, down 8 percent from 1988. Total value of vegetables sold for processing was \$1.2 million.

Cattle and Calves

Utah cattlemen had a total of 800,000 cattle and calves on farms on January 1, 1990, down 4 percent from the previous year. The all-cow inventory at 413,000 head, was down slightly from last year's level of 418,000 head. Beef cows at 333,000 head, dropped 3 percent from the 1989 level, while milk cows at 80,000 head, increased 6,000 head from the previous year. Beef cow replacement heifers weighing 500 pounds or more were estimated at 59,000 head--a drop of 1,000 from last year. Milk cow replacements totaled 49,000 head, compared with 42,000 in 1989. Other heifers at 41,000, dropped 7,000 head from the previous year's level. A large part of the decrease in cattle numbers was in the category of steers weighing 500 pounds or more. The January 1, 1990 level was at 90,000 head--a drop of 12,000 from the previous year. Bulls at 20,000 head, dropped 3,000 from last year. Calves weighing less than 500 pounds were estimated at 128,000 head, down 7 percent from January 1, 1989.

Utah's 1989 calf crop totaled 360,000 head, down 4 percent from the previous year. The calving rate was 87 percent, 3 percent below the previous year. Cattle and calves on full feed for slaughter totaled 41,000 head, a 7,000 head decrease from the 1989 level.

The 1989 estimate of the number of cattle operations was 8,300--down 200 from the previous year.

The average value per head was \$700.00 on January 1, 1990, compared with \$645.00 on January 1, 1989. The total inventory was valued at \$560.0 million, up 5 percent from the 1989 level.

Beef production during 1989 totaled 334.4 million pounds, up fractionally from the previous year. Marketings during the year, at 412.7 million pounds, were up 12 percent from 1988. Total cash receipts for the year were at \$287.1 million--up 12 percent from the previous year. The average price per hundredweight (cwt.) of cattle was \$67.00, a 50 cent increase from the 1988 average, while calves averaged \$89.40 per cwt. during the year, down \$2.10 from the previous year.

1/ Includes slaughter in Federally inspected plants and in other slaughter plants, but excludes animals slaughtered on farms. 2/ Annual data are incomplete in years that monthly data were not published to avoid disclosing individual operations. 3/ First year of record. 4/ Not printed to avoid disclosing individual operations.

Dairy

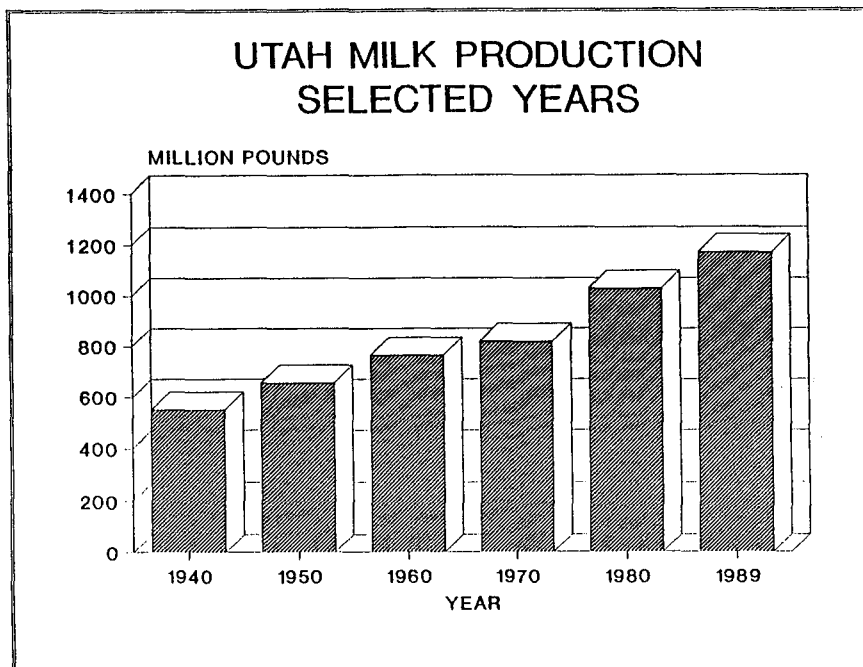

Utah dairymen produced a total of 1,170 million pounds of milk during 1989, up fractionally from the 1988 level. The 1989 production was 1 million pounds below the record level set in 1983.

Production per cow, at 15,395 pounds, increased 239 pounds from 1988, and marked the fifth straight year of increasing milk production per cow. The 1989 milkfat per cow was at 556 pounds, compared with 549 pounds the previous year. Milk per cow, and milkfat per cow, were both new highs.

There were an estimated 1,500 farms with milk cows during 1989--100 below the 1988 number. The number of milk cow farms has decreased steadily over the past seven years.

Cash receipts from milk marketings during the year totaled 148.3 million, up 9 percent from 1988, but 1 percent below the record set in 1983. The price per hundredweight (cwt.) of all milk was \$12.90, compared with \$11.93 received the previous year, and the record high of \$13.24.

Utah's 1989 total cheese production was at 65.0 million pounds--2 percent above the 1988 level. American cheese production, at 37.7 million pounds, increased 5 percent from the previous year. Cheddar cheese accounted for 61 percent of the total American cheese produced. Production of Swiss cheese totaled 23.3 million pounds, a 3 percent decrease from 1988. Swiss cheese accounted for 36 percent of the total cheese produced. Other types of cheese accounted for the remainder of the cheese produced. Ice cream production was at 8.0 million gallons--25 percent below the record high set last year. Ice milk, at 3.7 million gallons, was 5 percent below 1988. There were 21 dairy plants in Utah that produced 1 or more dairy products during 1989.

Sheep and Wool

Utah's sheepmen had a total of 509,000 sheep and lambs on farms on January 1, 1990, up 1 percent from the previous year. Inventory of stock sheep and lambs at the beginning of 1990 was 485,000 head--a 1 percent increase from the 1989 level. Ewes one year old and older totaled 407,000 head, up 2,000 from a year earlier. Rams and wethers over one year of age totaled 13,000 head--up 1,000 from January 1, 1989. Ewe lambs 3 months old and older were at 58,000 head, compared with 57,000 in 1989. Ram lambs were at 7,000 head, also up 1 percent from the previous year. Sheep and lambs on feed for slaughter totaled 24,000 head, compared with 23,000 a year earlier. The 1989 lamb crop was estimated at 430,000 head--up 13 percent from the previous year.

There were an estimated 2,100 sheep operations in 1989, virtually the same as the 1988 level. The January 1, 1990 sheep and lamb inventory had an average value per head of \$94.00, up significantly from the 1989 level of \$84.50. The total value of Utah's sheep inventory was \$47.8 million, up 13 percent from the previous year.

Cash receipts during 1989 totaled \$19.1 million--19 percent above the 1988 level. Marketings of sheep and lambs totaled 35.7 million pounds, up 26 percent from the previous year. Average sheep price during 1989 was \$19.20 per hundredweight (cwt.)--80 cents below the 1988 average. Lambs averaged \$60.50 per cwt., 1 dollar below the previous year.

Wool production totaled 4.58 million pounds during 1989, fractionally above the 1988 production. Weight per fleece, at 10.1 pounds, was 3 tenths of a pound above the previous year.

Sheep & Lamb Losses

A survey was conducted which asked Utah sheepmen to categorize sheep and lamb losses by cause of death. The January 1, 1990 survey, sponsored by the Utah Department of Agriculture, was used to make State estimates of sheep and lamb losses in 1989.

Sheep and lamb losses totaled 95,000 head during 1989, a 20 percent increase from the 1988 level. Losses included 35,000 undocked lambs, 35,000 docked lambs, and 25,000 sheep. The total value of all losses was \$8.5 million--up 20 percent from the previous year. Predators accounted for 54 percent of all losses, compared with 45 percent in 1988. Nonpredator losses were 29 percent of the total, 12 percent below the previous year.

Coyotes were the major cause of loss during 1989, accounting for 39 percent of all losses, and a total value of \$3.3 million. Weather was the second leading cause, and was responsible for 7,200 deaths, with a total estimated value of \$643,000. Other major causes of loss were mountain lions, lambing complications, and disease.

Unknown causes accounted for 16 percent of all losses, and a total value of \$1.4 million.

Hogs and Pigs

The December 1, 1989 Utah hog and pig inventory was 27,000 head, 18 percent below the December 1, 1988 level. The total pig crop for the year was 38,300 head--17 percent below the previous year. A total of 5,100 sows farrowed during 1989, 14 percent below 1988. The number of hog and pig farms at 900, remained virtually the same as the previous year.

The average value per head of Utah's hogs and pigs on December 1, was \$76.50, \$7.00 above the 1988 level. The total inventory value was \$2.1 million, down 10 percent from a year earlier.

Cash receipts during the December 1, 1988 - December 1, 1989 period totaled \$3.87 million, up 2 percent from the previous year. Marketings during the year totaled 9.98 million pounds--a one percent drop from the 1988 level. The average price for hogs during 1989 was \$38.80 per hundredweight, \$1.10 above the previous year.

Chickens and Eggs

The value of eggs produced in Utah during 1989, totaled \$24.9 million, a new record high. This was 17 percent above the previous record set in 1988. Production of 460 million eggs was down 30 million from 1988, however, the average price of eggs per dozen was 65 cents, 13 cents above the previous year. The price of eggs was also a new record high.

The average number of layers during the year was 1.85 million--4 percent below the 1988 level. Eggs produced per layer was 249, compared with 253 the previous year.

Pounds of chicken sold at 3.7 million, dropped 13 percent from 1988. The average price per pound of chickens sold was 7 cents, up fractionally from the previous year. The value of chickens sold in 1989 was \$260,000--9 percent below the 1988 value.

^{1/} Estimates cover the 12 month period, December 1 previous year through November 30.

Turkeys

Utah turkey growers raised 3.59 million turkeys during 1989, 8 percent below the previous year.

The average price received per pound for turkeys was 52 cents, compared with 54 cents a year earlier. The total value of turkeys produced was \$44.1 million, 9 percent below the 1988 total value. Production of 84.7 million pounds dropped 6 percent from the previous year. The average live weight per bird was 23.6 pounds, compared with 23.1 pounds during 1988.

Utah turkey farms are located primarily in Sanpete and Sevier counties.

Bees and Honey

Utah honey production totaled 1.9 million pounds in 1989, up 28 percent from the 1988 level. This was the highest production recorded since 1979. The number of colonies, at 43,000, was up 7,000 colonies from the previous year. The value per pound of honey averaged 53 cents, down considerably from the 1988 price of 61 cents per pound. The total value of the honey produced in 1989 was 1.0 million dollars, 11 percent above the 1988 level.

Several Utah apiaries transport their bees to surrounding states, and honey produced during these moves is counted in the state where the honey was produced.

Mink

Utah mink farmers produced a record high 770,000 mink pelts in 1988, 12 percent above the previous record set in 1987. The number of females bred to produce kits in 1989 was 225,000, 8 percent above the previous year. Utah ranks second in the nation in mink production.

Standard was the most common type of pelt produced, accounting for 51 percent of all pelts taken. Demi-buff and Mohagony accounted for 21 and 10 percent, respectively.

There were 175 mink farms in Utah in 1988, compared with 165 in 1987. Leading mink producing counties were Morgan and Utah, which produced over 50 percent of all pelts taken. Other leading counties were Summit, Salt Lake, and Cache.

Farm Labor

The number of farm workers in the Mountain II region for the period of July 1989 through April 1990, peaked in July 1989 at 84,000 people, 1,000 fewer than in July 1988. The number of self-employed, unpaid, and hired workers also peaked in July at respectively 32,000, 22,000, and 30,000 workers. Total hours worked by all types of workers was also at the highest level during July.

Wage rates for the year were generally higher during the January and April survey periods, when the average wage rate for all hired workers, regardless of method of pay or type of worker was \$5.40 per hour. Workers paid on an hourly basis earned their highest wages of the year during July, when the average rate was \$4.91 per hour. Livestock workers received the highest wage rates of any nonsupervisor workers in the July, October, and January survey periods, but field workers received the highest nonsupervisor wage during the April survey period.

Agricultural Prices

The price data collected by the National Agricultural Statistics Service each year have a major impact on the farm industry. These prices are parts of a series, which determines deficiency payments, and are used to compute an Index of Prices Received by Farmers. This provides a single indicator of farm price trends at a given time.

Most prices after 1979 are based on actual sales by producers of a commodity during the entire month. Preliminary sales prices are obtained for the current month, based on sales around the 15th of the month. This "mid-month" price is revised the following month when sales data for the entire month become available. Livestock prices prior to 1980, and crop prices prior to 1977, are mid-month prices.

Hay prices are based on sales for the first half of the month and are not revised monthly. Wool prices are mid-month levels, and are revised annually. Prices for fluid and manufacturing grade milk are published only after data for the entire month are available. All other commodities, published on a monthly basis, follow the preliminary mid-month and revised entire month procedure outlined above. Many prices for Utah agricultural products are published only on an annual basis, because Utah produces a very small portion of the National total.

Yearly average prices for each commodity are weighted, based on the volume of sales of each commodity during a given month.

1/ Mid-month average price through 1979. Prices after 1979 are revised full month prices. 2/ Average for the month. 3/ Insufficient sales.

County Estimates

County estimates add another dimension to agricultural estimates. State estimates provide data to compare production in the various areas within Utah. Crop county estimates play a major role in Federal Farm Program payments, and Crop Insurance settlements; thus, directly effecting many farmers and ranchers. A cooperative agreement between the Utah State Department of Agriculture and the Utah Agriculture Statistics Service, U.S.D.A., provides funding in support of the county estimates contained in this publication.

Box Elder is "number one" in total grain production, (wheat, barley, oats, and corn). Cache County is the second largest grain producer; followed by Utah, Millard, and Sanpete Counties.

Wheat production is dominated by Box Elder County; followed by Millard, Cache, Utah, and San Juan.

Corn is grown in all but three of Utah's counties. Utah and Box Elder Counties together account for 38 percent of planted acres. Box Elder leads in production of grain corn, followed by Utah, Millard, Davis, and Weber. Utah is first in silage production; followed by Box Elder, Cache, Weber, and Sevier.

Box Elder leads all counties in 1989 for barley production. Cache County was second, followed by Millard, Utah, Sanpete, and Sevier Counties. Duchesne led in oats production; followed by Cache, Box Elder, Uintah, Emery, and Utah.

Millard County is first in alfalfa hay production, followed by Cache, Iron, Box Elder, Sanpete, and Utah Counties.

Cache County continues as the "number one" dairy county, with over twice the number of milk cows as Box Elder which ranked in second place. Utah County was third, followed by Weber and Sanpete Counties. Box Elder is "number one" in beef cows; followed by Rich, Duchesne, Uintah, Millard, and Utah Counties.

Sheep are found in all counties, but Sanpete County has the most. Iron County is second, followed by Utah, Summit, and Box Elder Counties.

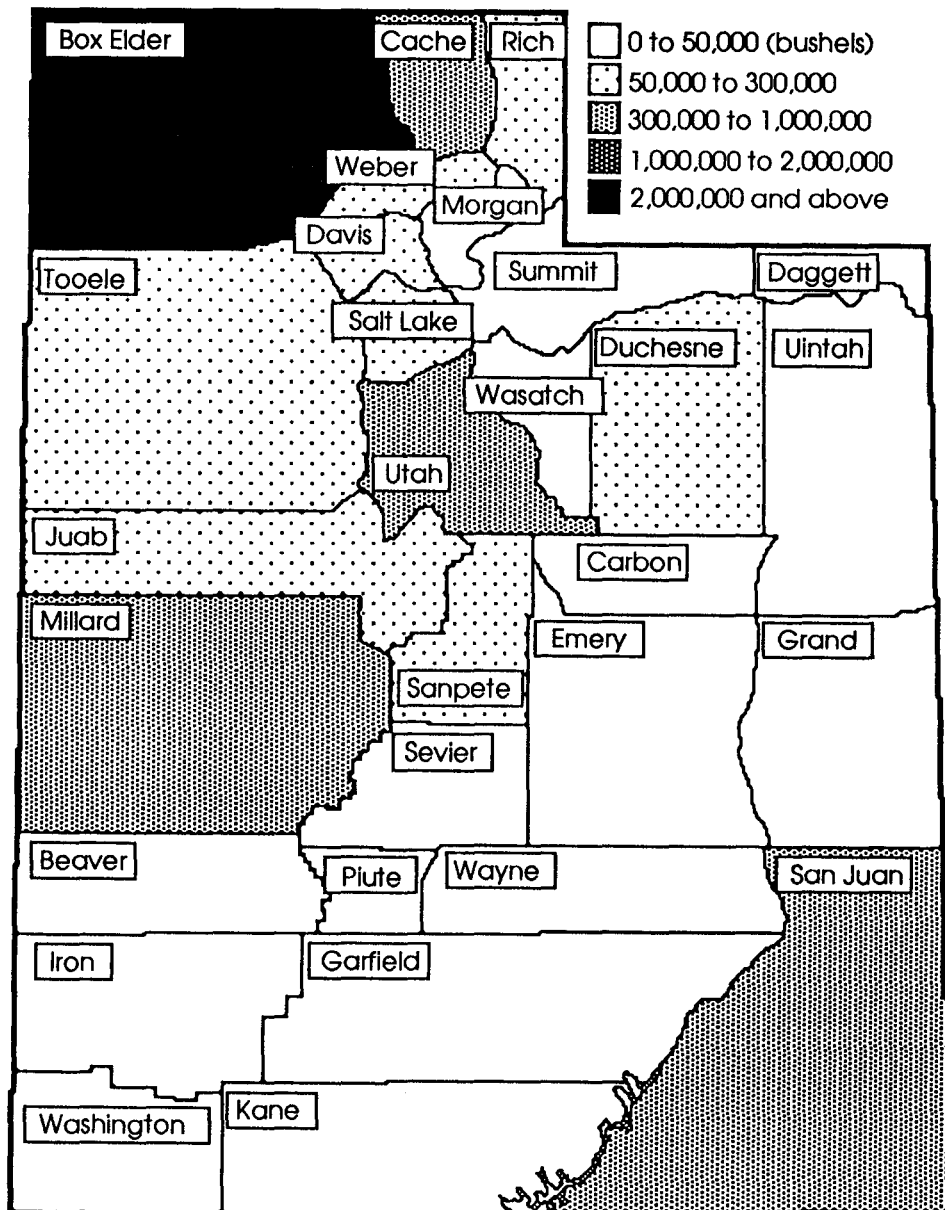

Sanpete County topped all counties for total cash receipts from agricultural commodities in 1988. Cache County is second, followed by Utah, Box Elder and Millard.

Weather

Gaylen L. Ashcroft, Associate Utah State Climatologist
Utah State University, Logan, Utah 84322-4825

In the tables below, values that are above normal are printed in boldface. The portion of the state that lies within each division can be determined from the map at the right.

Precipitation Summary: Overall, 1989 was a dry year for Utah, with only two months, July and August reaching near normal precipitation. By far, the driest division was Dixie, receiving less than fifty percent of normal rainfall during six months of 1989. In December, all of the divisions experienced far below normal precipitation, the highest being only thirteen percent of normal. While conditions throughout the state were dry on the whole, and generally the northern divisions experienced conditions that were below normal, the southern divisions suffered an even lower percent of normal precipitation.

PRECIPITATION, PERCENT-OF-NORMAL, BY CLIMATIC DIVISION, 1989

Enterprise Budgets

Prepared by the Economics Department, Utah State University

The following crop and livestock enterprise budgets were prepared by the Economics Department at Utah State University. Although not guaranteed, these budgets are provided to help farmers and ranchers identify potential alternatives to maximize the profitability of their operation. Actual costs and income will vary from farm to farm; therefore, a column has been provided to adapt the budgets to your farm or ranch.

Possible management strategies have been provided by both U.S.U. and the Utah Department of Agriculture.

An Enterprise Budget workbook will be available later this year through the Utah Department of Agriculture. It will include the budget information on pages 124-140, plus additional profitability tips. Contact El Shaffer, phone 538-7104, in Salt Lake City for ordering individual or bulk supplies of the workbook. A nominal printing and postage fee will be charged.

Any questions or suggestions to these budgets should be referred to the appropriate contact person in the Economics Department at Utah State University (phone (801) 750-2310 in Logan).

COW/CALF OPERATION BUDGET
ESTIMATED COSTS AND RETURNS BASED ON A 350 COW
COW/CALF OPERATION LOCATED IN RICH COUNTY UTAH (1989)
82% Weaning Percentage

Horse					240	0.69	-----
Buildings					713	2.04	-----
Total Noncash Costs					9,295	26.56	-----
Total Cash and Noncash Costs					121,294	346.55	-----
RETURN TO LAND AND MANAGEMENT					7,477	21.36	-----

Assumptions: 350 brood cows, 82% weaning percentage, bull replacement rate 33%, and 42 cows replaced every year (42 heifer calves saved back for replacement).

Budget prepared by Jodie Harris and DeeVon Bailey cooperating with Rich County producers.

Possible management strategy: Increase weaning percentage from 82% to 87%. This could possibly be accomplished by a more intensive feeding program for replacement heifers as outlined in the stocker feeder budget in this publication. The additional costs of following the stocker feeder program would be about \$107/head for each of the replacement heifers.

Additional Costs:

Feed @ \$107/head for 42 head	= \$4,495
Pregnancy testing, Pelvic Measurement and Bull Fertility Testing	= <u>\$1,000</u>
Total Additional Costs	\$5,495
Increased Gross Income:	
9 steers @ \$459/head =	\$4,131
9 heifers @ \$360/head =	<u>\$3,240</u>
Total	\$7,371
	\$7,371 - \$5,495 = \$1,876 Potential increase to Land and Management

Culling after careful examination through pregnancy testing and pelvic measuring of heifers and fertility testing of bulls for virility and disease, plus improving range by reseeding and management practices can all increase profitability.

COW/CALF/YEARLING OPERATION BUDGET
ESTIMATED COSTS AND RETURNS BASED ON A 200 COW
COW/CALF/YEARLING OPERATION LOCATED IN SOUTHERN UTAH (1989)

Total Cash and Noncash Costs					70,231	351.16	-----
Return to Land and Management					6,095	30.48	-----

Assumptions: 200 brood cows, 80 % weaning percentage, bull replacement rate of 33 %, and 15 % of cows replaced every year (30 heifer calves saved back for replacement).

Budget prepared by E. Bruce Godfrey in cooperation with producers in southwestern Utah.

Some operations may be able to utilize cheaper feeds (e. g., straw, grass hay, or lower quality alfalfa hay) during the winter months. Recent research at Utah State University has shown that winter feeding costs could be reduced by as much as one fourth with these cheaper feeds. If these cheaper feeds can be obtained, net returns may be increased by as much as \$5,000 provided operators are able to maintain production with these feeds.

DAIRY BUDGET
ESTIMATED COSTS AND RETURNS PER COW (1989)
FOR THREE HERD SIZES

	Small (60 Cows) 16,600 Pounds	Medium (100 Cows) 17,200 Pounds	Large (190 Cows) 17,800 Pounds	Your Farm

Total Costs	2,100	2,037	2,174	-----
RETURNS PER COW TO CAPITAL ASSETS, MANAGEMENT, AND UNPAID FAMILY LABOR				
	186	409	357	-----

1/ @12.48/cwt. for large dairies, \$12.44/cwt. for medium dairies, and \$11.95/cwt. for small dairies. 2/ Assuming 33% turnover with 3% death loss and 30% sold as 1,400 lb. cull cows at \$0.50/lb. 3/ At 0.40 head per cow per year. 4/ At 0.40 head per year. Value increases as herd productivity increases. 5/ Average production costs taken from actual farm records in Cache County. 6/ At 12% interest. 7/ At 1/3 of value. 8/ Facilities and equipment fixed costs were established as the "book value" depreciation during 1989 for the medium and large farms. Fixed Costs for the small dairy were calculated as a percent of the large dairy's fixed costs.

Budget prepared by DeeVon Bailey and Clark Israelsen.

Possible management strategy: Reduce calving interval from 14 months to 13 1/2 months through better heat detection.

Additional Costs: Labor \$700
 Materials \$300
Total Additional Costs: \$1,000

Additional income: 560 lbs/cow x \$12/cwt for milk = \$67/cow or \$6700

Net Additional income:
Potential additional return to land and management = \$5,700 or
\$57/cow for a 100 cow milking herd.

STOCKER FEEDER OPERATING BUDGET
ESTIMATED COSTS AND RETURNS
BASED ON A 100 HEAD OPERATION

Item	Number	Weight	Price	Unit	Total Value	Amount Per Steer	Your Operation
			(\$)		(\$)	(\$)

RETURN TO MANAGEMENT					(549)	(5.49)	_____

1/ Gain 1.75 pound per day for 150 days = 263 pounds.

2/ Feeding Costs include feed preparation and delivery to the manger.

3/ Interest on the steer and 1/2 cost of feed for 150 days.

4/ Average value of the steer ($(\$614.70 + \$432.60) / 2$) times 1.5%

Contact Person: Dr. Norris J. Stenquist

Possible management strategy: Reduce death losses to 0.5% by proper vaccination and spending additional time each day checking and "doctoring" animals.

Additional Costs:	Labor	\$187
	Materials	\$150
Total Additional Costs		\$337

Additional income: 1 steer = \$614.70

Potential addition to Return to Management = \$277.70 or \$2.78/head.

Another option is to plant turnips following small grain harvest to provide low cost high energy fall feed. See turnip management strategy on winter wheat budget for potential returns.

FINISH CATTLE OPERATION BUDGET
 ESTIMATED COSTS AND RETURNS BASED ON A 1500 PLUS
 FEEDYARD OPERATION LOCATED IN BOX ELDER COUNTY, UTAH (1989)

ASSUMPTIONS

Number of ewes bred in herd	200	Percent slaughter lambs	1
Percent of ewes replaced	20	Percent Lambs Weaned	110
Percent of rams replaced	33	Number of Ewe Lambs	500
Number of ewes per ram	33	Months on BLM	5.5
Percent ewe death loss	12	Months on Forest Service	4.5
Percent ram death loss	20	Months on Leased Land	1.5

Budget prepared by E. Bruce Godfrey and Gary Anderson (Sanpete County agent) in cooperation with a group of producers in Central Utah.

This budget represents an average of producers who participated in the panel. They included shed and range lambing operations as well as meat and wool breeds. As a result, the costs and returns for particular operators will commonly differ from the averages shown.

Operators who can increase their weaned lambing percentage by 10 percent could increase net returns by about \$17,000 if costs did not also increase. There are few variables that can have a larger impact on the net returns obtained by producers.

^{1/} Purchase made every third year, 1/3 of cost included each year.
^{2/} Irrigation Costs are calculated assuming a pivot watering 130 acres. An electric motor with a life of 10 years is used and costs are estimated for a 300 foot well that waters a total of 400 acres. The fixed costs for the well and sprinkling equipment were calculated assuming a 30 year amortization schedule.

Budget prepared by Doug Eck, Jody Gale and DeeVon Bailey with input from a number of producers.

RETURN TO LAND AND MANAGEMENT					120.18

Budget prepared by Doug Eck, DeeVon Bailey, and Tom Reeve

Possible management strategy: Double crop turnips following small grains. Place 550 lb. steers with a stocking rate of 6 steers/acre and an average gain of 1.75/lbs/day for 60 days. This strategy is based on information from Washington State University, modified for Box Elder County conditions.

Potential additional Costs per acre:

Harrowing = \$4.25 (After straw removal)
 Fertilizer Application = \$3
 (Seed included in fertilizer)
 Seed @\$1/lb = \$4
 Fertilizer 70 units of nitrogen = \$16.80
 Two irrigations = \$3.84 (variable costs only)
 Purchase six 550 lb feeder steers @ \$528/head = \$3,168/acre
 Fencing = \$9
 Implant @ \$1.50/steer = \$9
 Labor for cattle = \$63
 Vet, Medicine, marketing, trucking, death loss
 interest, and misc. expenses = \$144
 Total Additional Costs per acre = \$3,424.89

Potential additional Income: Assuming a stocking rate of 6 head/acre and a gain of 1.5/lb/day for 60 days.

Six 640 lb. steers @ \$91/cwt = \$3,494.40

Potential additional return to land and management = \$69.51/acre

RETURN TO LAND AND MANAGEMENT				5.46	_____

Budget Prepared by Doug Eck and DeeVon Bailey.

Possible management strategy: Soil test every third year. One expert believes that soil testing will increase yields over time by an average of 10%. This would increase total receipts by an average of \$19.20 per acre. Additional costs would include a soil test that is conducted every third year (about \$0.07/acre/year) and any additional fertilizer that would be purchased and applied.

See winter wheat budget for possibilities of raising turnips after the barley crop is harvested.

CORN GRAIN BUDGET

RETURN TO LAND AND MANAGEMENT				134.25	-----

1/ Applied two out of every three years so only 2/3 of cost included. 2/ Purchases made every third year, 1/3 of cost is included each year. 3/ Pesticide applied while drilling.

Budget prepared by Doug Eck, DeeVon Bailey, Tom Reeve, and Lyle Holmgren.

Possible management strategy: Harvest as silage instead of grain.

Increased income: Corn silage = \$562.50 (22.5 tons @ \$25/ton.
Note, the corn silage yield is based on 25 tons of green corn silage (30-32 % dry matter) harvested with 10% spoilage.

Decreased costs: Combining \$23.00
Hauling \$5.00
Drying \$24.00
Offset disking \$15.37

Total Increased Income and reduced costs = \$629.87 /acre

Decreased Income: Corn grain 160 bu. @ \$2.65/bu. = \$424.00/acre
Increased costs: harvesting corn silage = \$111.15/acre
Total decreased income and increased costs = \$535.15/acre

Additional return to management for this strategy (total increased income and reduced costs minus total reduced income and reduced costs) = \$94.72/acre.

Budget prepared by Terry Glover with modifications by DeeVon Bailey.

The following table displays breakeven prices for different yields and different lengths of stands. The cost of establishing grass seed decreases the more years the stand is harvested. However, the average yield per acre does not remain constant since yields may increase in the first years after planting and eventually decrease in later years. The following table displays the impact on break-even prices of this interaction between yields and the number of years the stand is harvested. Choose the number of years the seed will be harvested and then estimate the average yield over that many years to determine the average price you will need to receive over time to cover costs.

Break-even prices per cleaned pound of seed based on yields and the number of years the grass seed stand will be harvested.

Years Harvested	Pounds of clean seed per Acre

^{1/} Labor costs are estimated on a per acre basis rather than by operation as suggested by the producer panel.

Budget prepared by Jodie Harris with input from a producer panel.

Processing is almost one-half of total cost for raising apples. Packing and processing apples by yourself or cooperatively with your neighbor(s) may help reduce your costs and increase your profits.

HIGH RESIDUE CONSERVATION TILLAGE INCREASES SOIL MOISTURE AND PROFITS

By V. P. Rasmussen and R. L. Newhall, Soil Sci. & Biomet, Utah State University

Erosion Control:

The 1985 Food Security Act (the current farm bill) requires high-residue (high surface-straw cover) tillage techniques for many USDA Conservation Plans that are mandated by law on HEL (highly erodible land). Landowners and operators must alter many of their traditional tillage practices to remain eligible for USDA programs, insurance, and disaster assistance. These techniques are so new and innovative that it was deemed advisable to include research on them in this publication.

The Soil Science & Biometeorology Department at Utah State University has been conducting tillage research and demonstration plots on several watersheds throughout the State of Utah since 1982. Generous support from the Utah State Department of Agriculture, the Utah Energy Office, the Utah Association of Conservation Districts, the USDA-Soil Conservation Service, and other groups have helped to make this an ongoing, cooperative effort. Without the support of these auxiliary groups, research and educational efforts with conservation tillage and low-input agriculture would be minimal, at best, in Utah. However, cooperative efforts, such as this, add new dimensions to agricultural production in the State. Several new, beneficial cropping systems have been developed from this research, including optimal fertilizer placement techniques, no-till drill development and comparisons, and moisture-saving chemical fallow techniques.

Two 1988 studies at different sites with different soils (one highly-eroded HEL soil and one moderately-eroded HEL soil) in the Clarkston Watershed have been summarized. The studies focused upon different ways of meeting the tillage requirements of the "Conservation Compliance" provisions of the 1985 Food Security Act. It is often difficult for growers to drastically change their established tillage patterns in order to meet the stringent requirements of farming HEL soils according to the FSA of 1985 regulations. We set out several fallow-year tillage patterns in which we computed and measured erosion and compared estimated tillage costs for each practice.

Conclusion: The chemical-fallow (no-till) treatments are better both in conserving soil and increasing profits. However, the cost of applying chemicals was low in 1988, due to the drought that limited weed growth and necessitated only one chemical treatment. The USU-recommended practice of combining tillage and chemical treatments and the chisel-only system were both within reasonable limits of cost--but they both accelerated erosion. On steep, highly erodible soils, such as these, the chemical fallow treatment is probably the method of choice. However, on slopes that are less than these, chisel plow methods can be used and still meet the FSA-85 requirements. Traditional disk and inversion plow methods are much more costly to the grower and can seldom meet the FSA-85 requirements. In addition, the measured dryland moisture savings under chemical fallow (1-2 inches per year) offer an additional incentive for growers to change their traditional methods.

Table 1 gives the tillage costs and calculated erosion values for each of the two sites. The calculations were identical to those used by the USDA-SCS to calculate conservation compliance for FSA-85 certification.

- 5 Conservation Tillage System - Chemical Fallow

2/ Site #1 (Ravsten Farm) -- Moderately eroded soil. (Soil: Mendon-Collinston Complex, 6 to 30% slopes, Class #VIe-U).

3/ Site #2 (Thompson Farm) -- Highly-eroded soil. (Soil: Wheelon-Collinston Complex, 10 to 30% slopes, Class #VIe-U1).

Moisture Conservation:

Moisture conservation studies have also been conducted at the Bluecreek and Nephi Experimental Farms, and at several "on-farm" Extension demonstrations across the State. These studies have shown that soil moisture (as much as 1 to 2 inches per year) can be saved with high-residue (surface mulch) conservation tillage systems.

Table #2 gives the most recent yield data from the experimental farm plots and one other (Bluecreek Field #2) located on a commercial farm near the Bluecreek Experimental Station. Note that the yields from the chemical fallow treatments generally exceed other yields. This is simply due to the moisture-saving nature of our newer chemical fallow methods.

CHEMICAL FALLOW

Cost savings and increased sales can result from using chemical fallow practices. The following worksheet was prepared by a major chemical company. It helps you analyze the potential savings on your operation.

Note: Only use pesticides when needed and at the rates prescribed on the label. Just because your neighbor is spraying doesn't mean you should. When you spray, you potentially kill insect friends, as well as enemies. Save the cost if spraying isn't necessary. Applying at the recommended rate can also save money. If you have questions, contact your County Agent.

1. SAVE TILLAGE.

How many tillage trips do you make for weeds between harvest and planting? How much do tillage trips cost you each trip?

Sample Cost/Tillage Trip/Acre

Flow	Chisel	V-Blade	Disk	Field Cult.	Rod Weeder
\$9.00	\$5.00	\$4.50	\$5.00	\$4.00	\$2.50

Cost/Acre

- Trip 1 \$ _____ A chemical fallow application
 Trip 2 \$ _____ between harvest and planting
 Trip 3 \$ _____ can replace an average of two
 Trip 4 \$ _____ to three tillage trips.
 Trip 5 \$ _____ How many can you save?
 Trip 6 \$ _____

How many dollars/acre can you save by reducing tillage trips with chemical fallow?

(answer 1) \$ /ac.

2. SAVE MOISTURE.

University data* show that 1/3 to 1/2" of soil moisture can be lost with each tillage trip.
 *1977 Farm Journal

Number of Tillage Trips Eliminated	Potential Moisture Savings	Potential Yield Increases	
		Fall Wheat	Spring Wheat
1	.5"	2.0	3.5
2	1.0"	4.0	7.0
3	1.5"	6.0	10.0

- - - Bushels per Acre - - -

Est. your potential yield increase. _____ bu/ac.
 Times your current price/bu. \$ _____ /bu.

Equals potential increase/acre \$ /ac.
 (answer 2)

3. SAVE TIME.

Saving time allows you to plant earlier and earlier. Planting may led to higher yields!

Sample PNW University Test Plots

Planting Date	Spring Barley	Spring Wheat	Fall Wheat
	Tons/Acre	- - Bushels/Acre - -	
April 1-11	2.08	18.0	
After April 26	1.80	11.5	
By Oct. 1			40.9
After Oct. 10			27.4

What is your value of optimum planting? _____ bu/ac.

Times your current price/Bu. \$ _____ /bu.

Equals potential increase/acre. \$ _____
 (answer 3) _____ /ac.

4. SAVE SOIL.

Another benefit of less tillage is reduced erosion. The chart below indicates soil loss due to wind and water.

Estimate Soil Loss in Tons/Acre/Year

	Wind	Water
Black Fallow.....	13.1	7.4
Stubble Mulch Fallow	3.5	4.6
Chemical Fallow	Trace	Trace

How much are you willing to pay per acre to reduce soil erosion? (answer 4) \$ _____ /ac.

5. HERBICIDE (for chemical fallow)

What does your herbicide cost per gallon? \$ _____
 What is your rate/acre? _____ oz/ac.
 Rate/acre _____ oz. times \$ _____ gal. divided by 128.

Equals herbicide cost/acre. \$ _____ /ac.
 What is your application cost/acre? .. \$ _____ /ac.

Total herbicide cost/acre \$ _____
 (answer 5) _____ /ac.

6. CHEMICAL FALLOW PAYOUT.

Tillage Savings (answer 1) \$ _____ /ac.
 Moisture Savings (answer 2) \$ _____ /ac.
 Time Savings (answer 3) \$ _____ /ac.
 Soil Savings (answer 4) \$ _____ /ac.
 Total \$ _____ /ac.

Minus herbicide cost/acre .. (answer 5) \$ _____ /ac.

Equals Chemical Fallow Payout/Acre. .. \$ _____ /ac.

Multiply by the acres you could be using in this system, to equal the total chemical fallow payout.
