## CROP PROGRESS AND CONDITION WEEK ENDING MAY 4, 2025

**AGRICULTURAL SUMMARY:** Northern Wyoming received precipitation last week and reports showed 6.6 days suitable for fieldwork last week, according to the Mountain Regional Field Office of the National Agricultural Statistics Service, USDA. Precipitation accumulations ranged from a trace to 2 inches, according to the National Oceanic and Atmospheric Administration (NOAA). Temperatures in central and southeastern Wyoming were slightly above average, but much of the western part of the State was 1 to 3 degrees below normal, according to the National Integrated Drought Information System (NIDIS) climate maps. Overall, drought conditions improved this past week, according to the U.S. Drought Monitor report published for April 29. The amount of land rated drought free was increased to 29 percent, compared to 21 percent. Land rated abnormally dry covered 21 percent of Wyoming, down 6 percentage points from April 22. Moderate drought was found in about 30 percent of Wyoming, down slightly from the last report. Severe conditions dropped to 12 percent compared to 14 percent last year and extreme drought remained the same at 8 percent. Even though drought conditions improved, producers started irrigating earlier than normal in central Wyoming which is a cause for concern about the future availability of irrigation water.

Hay and roughage supplies for Wyoming were reported as 12 percent very short, 24 percent short, 51 percent adequate, and 13 percent surplus. Stock water supplies were reported as 10 percent short, 84 percent adequate, and 6 percent surplus, compared with 1 percent very short, 5 percent short, and 94 percent adequate last year. Irrigation water supply was reported as 12 percent very poor, 14 percent poor, 16 percent fair, and 58 percent good, compared with 1 percent fair and 99 percent good last year. Cattle death loss was reported as 24 percent average and 76 percent light, compared with 1 percent heavy, 54 percent average, and 45 percent light last year. Sheep death loss was also reported as 24 percent average and 76 percent light, compared with 9 percent heavy, 57 percent average, and 34 percent light last year.

**NOTE:** The Crop-CASMA (**C**rop **C**ondition and **S**oil **M**oisture **A**nalYTics) for Root Zone Moisture can be accessed at [www.nass.usda.gov/Statistics by State/Wyoming](http://www.nass.usda.gov/Statistics_by_State/Wyoming) by clicking Crop Progress & Condition. For this data product, the root zone is defined as the top 3.2 feet of soil (approximately 1 meter).

### CROP AND LIVESTOCK PROGRESS
